|   | Number of study hours  | 60   |   | 5.0        |                        | 60.0  |         | 125 |  |
| Subject objectives                          | To familiarize students with selected types of digital modulation used in radio communication systems.   |  |   |            |                        |   |         |     |  |
| Learning outcomes                           | Course out   | Subject outcome                                    |   |            | Method of verification |   |         |     |  |
|   | [K6_U06] can analyse the<br>operation of components, circuits<br>and systems related to the field of<br>study, measure their parameters<br>and examine technical<br>specifications |  | students experimentally verify  |            |                        | [SU3] Assessment of ability to<br>use knowledge gained from the<br>subject                      |         |     |  |
|   | [K6_W34] Knows the<br>characteristics of<br>telecommunications channels,<br>methods of securing information,<br>modulation systems, methods of<br>access to the channel.           |  | The student knows the modulation<br>techniques in modern<br>radiocommunication systems with<br>particular emphasis on block<br>diagrams of selected modulators<br>as well as demodulators and<br>digital detectors. He knows the<br>criteria for assessing the quality of<br>transmission in digital systems<br>and is able to explain which<br>system parameters and how they<br>affect the quality of transmission. |            |                        | [SW1] Assessment of factual knowledge   |         |     |  |

| Subject contents   | <ol> <li>Role of modulation and encoding in radiocommunication system 2. Digital passband transmission. 3.<br/>Multilevel modulation techniques MPSK. Signal constellation. 4. Signal envelope, bandwidth, and spectrum<br/>efficiency for phase keying modulation. 5. Multilevel modulation techniques: QPSK, OQPSK and Pi/4<br/>DQPSK. 6. Reception of phase keying signals. 7. Noise characteristics for received signals with phase<br/>keying: bit and symbol error rate. 8. Phase and amplitude keying system. QAM signal constellation. Es/No<br/>ratio. 9. Block diagrams of QAM modulator and demodulator. 10. Minimum frequency keying modulation<br/>MSK features and applications. 11. Minimum frequency keying with Gaussian filter GMSK. 12. Intersymbol<br/>interference of GMSK signals. Parameters selection of pre-modulation filter. 13. Reception of GMSK signals.<br/>14. Bit error rate as a function of BT for GMSK modulation. 15. Spectrum compactness of continuous phase<br/>signals. 16. Trellis coded modulation TCM and BCM. 17. Advantages of trellis coded modulation. 18.<br/>Principle of TCM modulation, mapping of coding sequences into the modulation symbols. 19. Free distance<br/>and Hamming distance. 20. Asymptotic coding gain (ACG). 21. TCM signals decoding. Calculation of a free<br/>distance. 22. Examples of signal constellation, selection of a convolutional code and ACG evaluation for<br/>TCM modulations. 23. The target of multi-carrier radiocommunication systems. 24. Selection of distance<br/>between sub-carriers. 25. Orthogonal frequency division multiplexing (OFDM). 26. Properties of OFDM<br/>signals in the radio fading channel. 27. Application of OFDM in the LTE system. 28. Role of a protective<br/>distance and its selection. 29. Example of a transceiver for OFDM system. 30. Noise characteristics of<br/>systems with digital modulations in a channel with fading.</li> </ol> |   |                               |  |  |  |  |
