| Subject contents   | The lecture: 1. Historical background, evolution of types and construction of fuel cells. 2. Eelectrode reactions, the equation of electromotive force: cathodic and anodic reactoins on for a hydrogen fuel cell, derivation of basic equation for the electromotive force regardless of losses. 3. Efficiency and maximum efficiency: term of efficiency, thermodynamic efficiency, derivation of formulae for efficiency of fuel cells. 4. The influence of pressure and gas concentration on the electomotive force of a fuel cell: the influence of oxygen and hydrogen partial pressures, the influence of fuel and oxidant utilisation, the influence of pressure in a cell, the influence of means of oxygen supply. 5. Operational cell voltage. Kinds of voltage losses in a cell: the current - voltage characteristics of choosen fuel cells, the reasons for the voltage losses and their classification. 6. Activation losses: the charge double layer, Tafel equation, derivation of equation for the magnitude of losses, the means of minimization of fuel cells losses. 7. The fuel crossover and internal currents losses: the origin, derivation of equation for the magnitude of losses, the means of minimization of fuel cells losses. 9. The summary equation of losses. 10. The dynamic features of fuell cells: the equivalent circuit of a fuel cell, the test of current interrupt as the method for identyfication and measurement of magnitude of losses, the dynamic characteristics of choosen types of cells. 11. Some details of fuel cells construction. Contemporary types of fuel cells: the basic features of fuel cells construction, construction of electrodes, connection of cells, bipolar plate, summary of basic parameters and applications of fuel cells.12. Energetic systems using PEM, AFC, PAFC, MCFC, SOFC cells. 13. Types and basics of fuel processing. 14. Fuel reforming systems. 15. Hydrogen storage. 16. Fuel cells as a source of alternating current. |   |                               |  |  |  |  |
|--|---|---|-------------------------------|--|--|--|--|
| Prerequisites and co-requisites                                | Basic knowledge of organic and inorganic chemistry. 2. Basic knowledge of thermodynamics of chemical reactions. 3. Basic knowledge of electrochemistry. 4. Basic knowledge of electric circuits theory.   |   |                               |  |  |  |  |
| Assessment methods and criteria                                | Subject passing criteria  | Passing threshold   | Percentage of the final grade |  |  |  |  |
|  | Credit for the course (written form)  | 50.0%   | 100.0%                        |  |  |  |  |
| Recommended reading  | Basic literature  | 1. J. Larminie, A. Dicks "Fuel cell systems explained, Willey, 2003. 2. K. Kordesh, G. Simader "Fuel cells and their applications, VCH, 2001. |                               |  |  |  |  |
|  | Supplementary literature  | 1. P. W. Atkins: "Physical Chemistry", Oxford University Press, 2018  |                               |  |  |  |  |
|  | eResources addresses  | Adresy na platformie eNauczanie:  |                               |  |  |  |  |
|  |   | Energetyka wodorowa i ogniwa paliwowe - Moodle ID: 33386<br>https://enauczanie.pg.edu.pl/moodle/course/view.php?id=33386                      |                               |  |  |  |  |
| Example issues/<br>example questions/<br>tasks being completed | Derivation of the formula for the electro motive force of a hydrogen fuel cell.  The influence of the presence of water on the work of a PEM fuel cell.   |   |                               |  |  |  |  |
|  | The findence of the presence of water on the work of a fill fuel cell.  |   |                               |  |  |  |  |
| Work placement   | Not applicable  |   |                               |  |  |  |  |
