

Subject card

Subject name and code	Industrial Computers and Embedded Systems, PG_00048151						
Field of study	Electronics and Telecommunications						
Date of commencement of studies	October 2021	Academic year of realisation of subject			2024/2025		
Education level	first-cycle studies	Subject group			Optional subject group Subject group related to scientific research in the field of study		
Mode of study	Full-time studies	Mode of delivery			at the university		
Year of study	4	Language of instruction			Polish		
Semester of study	7	ECTS credits			5.0		
Learning profile	general academic profile	Assessment form			exam		
Conducting unit	Department of Marine Electronic Systems -> Faculty of Electronics, Telecommunications and Informatics						
Name and surname of lecturer (lecturers)	Subject supervisor	dr hab. inż. Iwona Kochańska					
	Teachers	mgr inż. Mariusz Rudnicki dr inż. Jan Schmidt dr hab. inż. Iwona Kochańska					
Lesson types and methods of instruction	Lesson type	Lecture	Tutorial	Laboratory	Project	Seminar	SUM
	Number of study hours	30.0	0.0	30.0	0.0	0.0	60
	E-learning hours included: 0.0						
Learning activity and number of study hours	Learning activity	Participation in didactic classes included in study plan		Participation in consultation hours		Self-study	SUM
	Number of study hours	60		5.0		60.0	125
Subject objectives	<i>The objective of this course is to expose students with standards, architecture and design methodology of industrial computers, embedded systems and complex digital signal processing systems, and with programming techniques to effectively use the hardware resources of such systems.</i>						

Learning outcomes	Course outcome	Subject outcome	Method of verification
	[K6_U04] can apply knowledge of programming methods and techniques as well as select and apply appropriate programming methods and tools in computer software development or programming devices or controllers using microprocessors or programmable elements or systems specific to the field of study	Student observes and measures signals in real-time processing systems based on floating-and fixed-point digital signal processors.	[SU1] Assessment of task fulfilment
	[K6_U06] can analyse the operation of components, circuits and systems related to the field of study, measure their parameters and examine technical specifications	Student is able to analyse proper operation of the embedded system.	[SU1] Assessment of task fulfilment
	[K6_W04] Knows and understands, to an advanced extent, the principles, methods and techniques of programming and the principles of computer software development or programming devices or controllers using microprocessors or programmable elements or systems specific to the field of study, and organisation of systems using computers or such devices	Student discusses specific requirements for industrial processors and computers used in dedicated real-time systems and the resulting technical solutions. He presents architecture, functionality and performances of industrial computers of PC/104 standard and its extensions, DIMM-PC standard, VMEbus standard, and CompactPCI standard. He lists advantages and disadvantages, and compares standards of industrial computers. He presents general characteristics, architecture, and hardware implementations of real-time multiprocessor systems. He observes and analyzes operation of VMEbus, industrial system with single chip microcontroller. Student knows the basics of embedded systems architecture and capabilities of typical solutions available on the market. Student knows techniques for designing and programming multi-threaded embedded systems and the methodology of software development for embedded systems (HW / SW co-design).	[SW1] Assessment of factual knowledge

Subject contents	<ol style="list-style-type: none"> 1. Introduction 2. Industrial computers of PC/104 standard and its extensions. General characteristic and destination of PC/104 computers 3. Mechanical specification of PC/104 computers 4. Extension of PC/104 computers to PC/104 Plus standard 5. Extension of PC/104 computers to formats EBX and EPIC 6. Advantages and disadvantages of systems based on PC/104 standard 7. Industrial computers of VMEbus standard. General characteristic of the VMEbus 8. Architecture of VMEbus computers 9. Interface of computers with VMEbus 10. Operations realized on VMEbus 11. Mechanical specification of VMEbus computers 12. Selected application of VME standard computers 13. Industrial computers of CompactPCI standard. General characteristics of the bus 14. Techniques of configuration and transmission 15. Architecture of CompactPCI computers 16. Mechanical specification 17. Typical applications 18. Processor complex systems of digital signal processing. General characteristics. 19. Architecture. 20. Methods of hardware implementation of systems based on single-core processors 21. Methods of hardware implementation of systems based on multi-core processors 22. Multiprocessor systems 23. Single Board Computers (SBC). SBC architecture 24. SBC communication interfaces 25. Comparison of different SBC's 26. Embedded operating systems. POSIX standard 27. OS for embedded systems 28. Kernel and its surroundings in embedded systems 29. Process manager. Memory management. Managing the namespace. 30. Threads and processes. Methods for thread synchronization. Interprocess communication 31. File systems 32. Developing software for embedded systems. C++ programming in OS Linux 33. Working in integrated Eclipse CDT 34. Software cross-compilation for embedded systems 35. OpenCV library 36. Python programming 37. Network programming for embedded systems 38. Cloud computing. Communication with the cloud. 39. Techniques for efficient use of hardware resources. Methods for code optimization 40. Hardware and software techniques power consumption minimalization 		
Prerequisites and co-requisites			
Assessment methods and criteria	Subject passing criteria	Passing threshold	Percentage of the final grade
	Midterm colloquium	50.0%	50.0%
	Practical exercise	50.0%	50.0%
Recommended reading	Basic literature	<ol style="list-style-type: none"> 1. Kozielski S., Szczerbiński A. Komputery równoległe, architektura, elementy programowania. WNT Warszawa 1994 2. Heath S. Vmebus: a practical companion. Butterworth-Heibemann 1994 	
	Supplementary literature	No requirements
