

## Subject card

Subject name and code	Strength of Materials , PG_00055379						
Field of study	Mechanical Engineering						
Date of commencement of studies	October 2021	Academic year of realisation of subject			2022/2023		
Education level	first-cycle studies	Subject group			Obligatory subject group in the field of study Subject group related to scientific research in the field of study		
Mode of study	Full-time studies	Mode of delivery			at the university		
Year of study	2	Language of instruction			Polish		
Semester of study	3	ECTS credits			10.0		
Learning profile	general academic profile	Assessment form			exam		
Conducting unit	Department of Mechanics and Mechatronics -> Faculty of Mechanical Engineering and Ship Technology						
Name and surname of lecturer (lecturers)	Subject supervisor	dr hab. inż. Mirosław Gerigk					
	Teachers	mgr inż. Katarzyna Pytka mgr inż. Grzegorz Banaszek dr hab. inż. Mirosław Gerigk					
Lesson types and methods of instruction	Lesson type	Lecture	Tutorial	Laboratory	Project	Seminar	SUM
	Number of study hours	45.0	60.0	15.0	0.0	0.0	120
	E-learning hours included: 0.0						
Wytrzymałość materiałów - MiBM - stud_stac - Moodle ID: 25876 <a href="https://enauczanie.pg.edu.pl/moodle/course/view.php?id=25876">https://enauczanie.pg.edu.pl/moodle/course/view.php?id=25876</a>							
Learning activity and number of study hours	Learning activity	Participation in didactic classes included in study plan	Participation in consultation hours	Self-study	SUM		
	Number of study hours	120	10.0	120.0	250		
Subject objectives	The aim of the course is to familiarize students with methods applied in the area of strength of materials						
Learning outcomes	Course outcome	Subject outcome			Method of verification		
	[K6_U06] is able to use mathematical and physical models for analysing the processes and phenomena occurring in mechanical devices within the range of material strength, thermodynamics and fluid mechanics	Student can formulate strength of material model of the tested construction and analyse its behavior considering loading and boundary conditions.			[SU1] Assessment of task fulfilment [SU3] Assessment of ability to use knowledge gained from the subject [SU4] Assessment of ability to use methods and tools [SU5] Assessment of ability to present the results of task		
	[K6_U01] is able to acquire information from specialized literary sources, databases and other resources, essential for solving engineering tasks; is able to compile the obtained information pieces and to interpret them, additionally is able to form conclusions and present justified opinion	Student can solve advanced problems related to the strength of materials of construction by using knowledge acquainted			[SU1] Assessment of task fulfilment [SU3] Assessment of ability to use knowledge gained from the subject [SU5] Assessment of ability to present the results of task		
	[K6_W05] possesses an organized and theoretically grounded knowledge within the range of strength analysis of basic mechanical constructions including stress and relaxation conditions, energetic methods, strength hypotheses	Student can state and solve simple tasks related to strength of materials of the given construction/ system			[SW1] Assessment of factual knowledge [SW2] Assessment of knowledge contained in presentation		

Subject contents	<p><b>LECTURES/TUTORIALS</b></p> <p>Area moments of inertia. Tension and compression of bars. Statically indeterminable problems. Thermal and assembly deformations. Torsion of bars. Bending of beams. Determination of inner forces and stresses in bars (dimensioning). Plane state of stresses. Mohrs circle. Principal stresses and maximum shear stresses. Theorem of Castigliano. Theorem of Menabrei-Castigliano. Method of Maxwell-Mohr. Buckling investigation. Calculation of statically indeterminable systems with a use of the force method. Unsymmetrical beam bending. Eccentric loading. Bending of thin-walled bars. Bending of curved bars. Calculation of thin-walled shells of revolution. Determination of stresses of the pressure vessels. Calculation of thick-walled cylindrical shells. The Lamé problem. Calculation of thick-walled pipes. Calculation of bending of axisymmetric plates. Fatigue strength problems. Fracture mechanics. Finite element method fundamentals: bar element and 2D planar element.</p> <p><b>LABS</b></p> <p>Static tensile and compression tests. Metal tension test: determination of elasticity modulus, conventional elasticity limit and conventional plasticity limit. Investigation of metal hardness. Metal torsion test and determination of shape elasticity modulus. Beam deflection investigation. Metal impact strength test. Impact test of a metal tension.</p>														
Prerequisites and co-requisites	The student should have basic information in the field of applied physics and mathematics, mathematical analysis, numerical methods, solid state mechanics, including kinetics and dynamics, technical drawing and the basics of programming.														
Assessment methods and criteria	<table border="1" data-bbox="448 750 1495 896"> <thead> <tr> <th data-bbox="448 750 794 790">Subject passing criteria</th> <th data-bbox="794 750 1141 790">Passing threshold</th> <th data-bbox="1141 750 1495 790">Percentage of the final grade</th> </tr> </thead> <tbody> <tr> <td data-bbox="448 790 794 824">Lectures passing</td> <td data-bbox="794 790 1141 824">56.0%</td> <td data-bbox="1141 790 1495 824">40.0%</td> </tr> <tr> <td data-bbox="448 824 794 857">Tutorials passing</td> <td data-bbox="794 824 1141 857">56.0%</td> <td data-bbox="1141 824 1495 857">30.0%</td> </tr> <tr> <td data-bbox="448 857 794 891">Labs passing</td> <td data-bbox="794 857 1141 891">56.0%</td> <td data-bbox="1141 857 1495 891">30.0%</td> </tr> </tbody> </table>			Subject passing criteria	Passing threshold	Percentage of the final grade	Lectures passing	56.0%	40.0%	Tutorials passing	56.0%	30.0%	Labs passing	56.0%	30.0%

	eResources addresses														
Example issues/ example questions/ tasks being completed	<ol style="list-style-type: none"> <li>1. Assembly stresses - arise as a result of correcting dimensional differences of the connected elements of the structure. Example. To install a bar of length <math>l</math> between two vertical walls, increase its length by <math>D</math>. A tensile force <math>N</math> appears in the cross-section of the bar, which causes assembly stresses.</li> <li>2. Example. A beam with a length of <math>2l</math> and stiffness <math>EI</math>, pinned at its ends, is loaded with a uniformly distributed load <math>q</math> acting on length <math>l</math>. Formulate the equation of deflection angles and deflection axis and determine the deflection angle and deflection at point B.</li> </ol>														
Work placement	Not applicable
