|   | E-learning hours included: 0.0  |  |  |                                     |  |            |     |
| Learning activity and number of study hours | Learning activity   | Participation in didactic classes included in study plan |  | Participation in consultation hours |  | Self-study | SUM |
|   | Number of study hours   | 45   |  | 6.0                                 |  | 49.0       | 100 |
| Subject objectives                          | Introduction to modeling of mechatronic systems.  |  |  |                                     |  |            |     |

| Learning outcomes               | Course outcome  | Subject outcome  | Method of verification                               |
|---------------------------------|---|--|--|
|                                 | [K6_U07] is able to design elements of mechatronic systems taking into consideration given application and economic criteria, using appropriate methods, techniques and tools   | Student presents a command of the methods of the stationary mechatronic systems; modelling. Student recognises the methods of modelling of as well; the mechatronic systems; structure, as; observed signals. Student elaborates physical models of mechatronic systems. Student defines group tasks of the mechatronic systems; modelling. Student designs open- and closed-loop models of mechatronic systems in interdisciplinary teams.  | [SU4] Assessment of ability to use methods and tools |
|                                 | [K6_W03] has organized and theoretically supported knowledge in terms of automation and control theory of stationary, continuous and discrete mechatronic systems, mechatronic design, developments and exploitation of mechatronic systems   | Student identifies phenomena accompanied functioning of mechatronic systems. Student presents a command of the methods of the stationary mechatronic systems; modelling. Student recognises the methods of modelling of as well; the mechatronic systems; structure, as; observed signals. Student elaborates physical models of mechatronic systems. Student defines group tasks of the mechatronic systems; modelling. Student designs open- and closed-loop models of mechatronic systems in interdisciplinary teams. | [SW1] Assessment of factual knowledge                |
|                                 | [K6_W09] knows and understands methods of mechatronic modelling and design of systems / stationary processes as well as utilized methods and techniques including structural modelling, modal analysis, optimal control, digital control and knows modelling languages as well as computer tools for design and simulation of systems / mechatronic processes   | Student identifies phenomena accompanied functioning of mechatronic systems. Student presents a command of the methods of the stationary mechatronic systems; modelling. Student recognises the methods of modelling of as well; the mechatronic systems; structure, as; observed signals. Student elaborates physical models of mechatronic systems. Student defines group tasks of the mechatronic systems; modelling. Student designs open- and closed-loop models of mechatronic systems in interdisciplinary teams. | [SW1] Assessment of factual knowledge                |
| Subject contents                | LECTURES. Basic terms. Creation of calculation models: Models of mechatronic systems components. Modelling of multi-body systems. Structural models. Modal models. Mathematical description: Analogies between physical environments. Dynamic equations in generalised coordinates. Control of mechatronic systems: Multidimensional control systems. Linear optimal control. Modal control. Closed-loop systems. Control systems design. Examples of modelling of mechatronic systems: Industrial robot. Chosen problems of vehicle dynamics. LABORATORY Introduction. Physical models of mechanical, electric, hydraulic and thermal systems. Modelling of multi-body systems. Structural modelling of mechatronic systems. Creation of dynamic equations of mechatronic systems in generalised and state coordinates. Modal analysis. Synthesis of multidimensional control system. Multidimensional linear optimal control system. Chosen example of modelling of mechatronic systems. PROJECT The students perform 2 projects in their own interdisciplinary teams, at simultaneous distribution of competences between several members. The tasks depend on creation of calculation models of the mechatronic systems with diversified physical nature, and on multidimensional control systems design. The first project concerns modelling of open-loop systems, while the second one considers additionally existence of feedbacks, due to accompanying working processes. During the projects performance one ought to focus a special attention on modelling in mechatronic systems as well the structure, as the signals. |  |  |
| Prerequisites and co-requisites | Knowledge on Mechanics and Strength of materials. Knowledge and experience on Fundamentals of automatic control. Knowledge and experience in Informatics (sem. II, IV). Knowledge on Mechatronic systems components.  |  |  |
| Assessment methods and criteria | Subject passing criteria  | Passing threshold  | Percentage of the final grade                        |
|                                 | Written exam  | 50.0%  | 50.0%  |
|                                 | Project   | 100.0%   | 25.0%  |
|                                 | Reports from laboratory exercises   | 100.0%   | 25.0%  |
