| | [K6_U04] is able to use analytical methods to formulate and solve project tasks | | the student is able to use analytical methods to formulate and solve design tasks in the field of structural design and mechanics | | | [SU3] Assessment of ability to use knowledge gained from the subject [SU4] Assessment of ability to use methods and tools | | | |
| | | | the student knows and understands construction, building and engineering problems related to the design of buildings; principles, solutions, structures in the field of structural design and mechanics | | | [SW1] Assessment of factual knowledge | | | |
| Subject contents | LECTURES: Introduction to the subject, structural elements. Elementary statics: scalars and vectors, principles of statics, static moment of force relative to the a point, pair of forces, reduction of plane force systems, equilibrium conditions. Impacts at construction, concentrated force, continuous load, concentrated moment. Schemes of bar systems, nodes and supports. Basic assumption of structural theory. Internal forces in statically determinate bar systems, relation between internal forces and external loading. Simple beams: free-ends beams, fixe beams, free-ends beams with bracket. Frame systems: beams with broken axis, three-hinged frames. Arch systems: internal forces in curved bars, pressure line. Plane truss systems, node counterpoise method, cross-section method. Built-up systems (jointed continuous beams, frame and truss systems, frame-truss systems). Variable loads (utilities): influence lines, loading of influence lines, extremal loading of influence lines. Envelopes of internal forces, load combination. EXERCISES: Elementary statics. Reactions of simple beams. Internal forces in simple beams. Jointed continuous beams. Beams with broken axis. Three-hinged frames. Arch systems. Truss systems. Frame-truss systems. Influence lines. Extremal values of reactions and bending moments. | | | | | | | | |
