|---------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------|-------------------------------------|------------|----------------------------------------------------------------------------------------------------------------------|---------|-----|
| Subject name and code | Fundamentals of Control Engineering I, PG_00053200 | | | | | | |
| Field of study | Automation, Robotics and Control Systems | | | | | | |
| Date of commencement of studies | October 2022 | Academic year of realisation of subject | | | 2023/2024 | | |
| Education level | first-cycle studies | Subject group | | | Obligatory subject group in the field of study Subject group related to scientific research in the field of study | | |
| Mode of study | Full-time studies | Mode of delivery | | | at the university | | |
| Year of study | 2 | Language of instruction | | | Polish | | |
| Semester of study | 3 | ECTS credits | | | 5.0 | | |
| Learning profile | general academic profile | Assessment form | | | exam | | |
| Conducting unit | Department of Intelligent and Decision Support Systems -> Faculty of Electrical and Control Engineering | | | | | | |
| Name and surname of lecturer (lecturers) | Subject supervisor | dr inż. Rafał Łangowski | | | | | |
| | Teachers | dr inż. Rafał Łangowski mgr inż. Mateusz Czyżniewski dr hab. inż. Robert Piotrowski mgr inż. Krzysztof Laddach | | | | | |
| Lesson types and methods of instruction | Lesson type | Lecture | Tutorial | Laboratory | Project | Seminar | SUM |
| | Number of study hours | 30.0 | 30.0 | 0.0 | 0.0 | 0.0 | 60 |
| | E-learning hours included: 0.0 | | | | | | |
| Learning activity and number of study hours | Learning activity | Participation in didactic classes included in study plan | Participation in consultation hours | | Self-study | SUM | |
| | Number of study hours | 60 | 5.0 | | 60.0 | 125 | |
| Subject objectives | The main module objectives are: a) to acquire knowledge needed for modelling and analysis of dynamic systems of low order, b) to design of regulatory controllers for such systems. | | | | | | |

| | | | |
|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------|
| Learning outcomes | Course outcome | Subject outcome | Method of verification |
| | [K6_W07] has basic knowledge related to control and automation systems | On successful completion of this course, the student will be able to: - Explain structures and properties of P, PI and PID controllers and experimentally determine their parameters by applying Ziegler - Nichols methods to lower order processes; - Explain structures of state-feedback controllers, also in the case of unmeasured state variables to lower order processes; - Design by pole placement the basic controller systems meeting the performance specifications in time domain and state observers. | [SW1] Assessment of factual knowledge |
| | [K6_U07] can build and analyze models of systems and systems in the field related to control systems and automation | On successful completion of this course, the student will be able to: - Derive the first principle dynamic models of the low complexity systems such as R, L, C electrical circuits, DC electrical motors, heat transfer and fluid flow systems; - Analyse basic properties of single input - single output (SISO) linear time invariant dynamic systems based on zeros and poles and to analytically calculate their responses to typical input signals; - Investigate stability of SISO systems based on the poles by applying the algebraic Routh-Hurwitz criterion - Investigate stability of feedback systems by applying the frequency domain based Nyquist stability criterion - Assess stability robustness of feedback systems based on the open loop system phase and gain margins. | [SU3] Assessment of ability to use knowledge gained from the subject |
| Subject contents | <p>LECTURES: Modelling the continuous time system dynamics for the SISO systems in time and frequency domain; linear differential equations, transfer function and frequency response function. Applications of the frequency response function to a low pass filter design. Calculating the linear system responses to the impulse, step and sinewave input signals. Calculating response of a linear system to an arbitrary input signal by applying convolution of the system impulse response and the input signal. Zeros and poles and their links with basic properties of a linear time invariant dynamic system. Algebraic Routh Hurwitz stability criterion. System structures: cascade and with feedback, Phase and gain margins. Performance measures in time domain of the control systems and their relationships with location of zeros and poles for the second order system dynamics. The P, PI and PID controllers: analysis and applicability conditions. Tuning the controller parameters by placement of poles and zeros and by Ziegler Nichols experimental rules. Structures of state-feedback controllers, also in the case of unmeasured state variables. Tuning the state observers gains by placement of poles. Illustration by applications to the R, L, C electrical circuits, simple mass-spring-damper mechanical systems, heat transfer and hydraulic systems. TUTORIALS: Modelling of control system elements and an overall control system, block diagram models of systems and their equivalent transformations, linearity versus nonlinearity of system dynamics, linearization of nonlinear system dynamics model, Laplace transforms in control systems, transfer function and frequency response function, Bode plots, Routh, Hurwitz and Nyquist stability criteria and application to feedback control systems, steady state errors in tracking control systems; P, PI and PID controller: structures, performance, applicability limits and parameter tuning.</p> | | |
| Prerequisites and co-requisites | Fundamentals of electrical circuits, DC motors and physics of simple mechanical, heat transfer and hydraulic systems. Linear time invariant and scalar differential equations, Laplace transforms, complex numbers. The Pre-Requisites: Mathematics terms 1,2; Physics term 1, Elektrotechnics term 1. | | |
| Assessment methods and criteria | Subject passing criteria | Passing threshold | Percentage of the final grade |
| | Exam | 50.0% | 50.0% |
| | Tests | 50.0% | 30.0% |
| | Midterm colloquium | 50.0% | 20.0% |
