

Subject card

Subject name and code	Analytics of Raw and Construction Materials, PG_00049360						
Field of study	Chemical Technology						
Date of commencement of studies	October 2022		Academic year of realisation of subject			2023/2024	
Education level	first-cycle studies		Subject group			Optional subject group Subject group related to scientific research in the field of study	
Mode of study	Full-time studies		Mode of delivery			at the university	
Year of study	2		Language of instruction			Polish	
Semester of study	4		ECTS credits			4.0	
Learning profile	general academic profile		Assessment form			exam	
Conducting unit	Department of Analytical Chemistry -> Faculty of Chemistry						
Name and surname of lecturer (lecturers)	Subject supervisor		dr hab. inż. Błażej Kudlak				
	Teachers						
Lesson types and methods of instruction	Lesson type	Lecture	Tutorial	Laboratory	Project	Seminar	SUM
	Number of study hours	30.0	0.0	15.0	0.0	0.0	45
	E-learning hours included: 0.0						
Learning activity and number of study hours	Learning activity	Participation in didactic classes included in study plan		Participation in consultation hours		Self-study	SUM
	Number of study hours	45		5.0		50.0	100
Subject objectives	Participants of the classes should learn the basic building materials, raw materials, additives, contaminants, wastes. They will apply knowledge of the chemical properties of construction materials to propose analytical procedure for the control of building materials, final products, wastes. Student will know validation protocol. The key analytical techniques used in analysis of building materials and products must be described.						

Learning outcomes	Course outcome	Subject outcome	Method of verification
	K6_W07	As a result of finishing the course the student will deepen her/his knowledge on construction materials, their degradation and preventing it.	[SW1] Assessment of factual knowledge [SW2] Assessment of knowledge contained in presentation [SW3] Assessment of knowledge contained in written work and projects
	K6_U11	As a result of finishing the course the student will deepen his/her skills in the area of planning and realizing self-education, reaching knowledge, resources in Polish and English.	[SU1] Assessment of task fulfilment [SU2] Assessment of ability to analyse information [SU3] Assessment of ability to use knowledge gained from the subject [SU4] Assessment of ability to use methods and tools [SU5] Assessment of ability to present the results of task
	K6_W02	As a result of finishing the course the student will ground knowledge in the area of quantitative and qualitative analytics of construction products and resources in relation to phenomena and chemical processes taking place in the chemical technology.	[SW1] Assessment of factual knowledge [SW2] Assessment of knowledge contained in presentation [SW3] Assessment of knowledge contained in written work and projects
	K6_U06	As a result of finishing the course the student will ground knowledge in the area of resources analytics, evaluating their quality, risk and challenges faced at different stages of obtaining resources and products manufacturing.	[SU2] Assessment of ability to analyse information [SU3] Assessment of ability to use knowledge gained from the subject [SU4] Assessment of ability to use methods and tools [SU5] Assessment of ability to present the results of task
Subject contents	<p>LECTURE Overview lecture Technical analysis in the industry and its scope. Construction materials, raw materials, additives, contaminants, wastes. Types of building materials, their characteristics and chemical properties. Analytical control of raw materials, auxiliary materials, final products, waste materials. Organization of analytic control. Sampling and preparation of a representative sample, and possible sources of error. Evaluation of the validity of the results. Documentation of the analytical laboratory. The analytical methods used in analysis of raw materials and construction products. Spectroscopic analysis. Mass spectrometry. Chromatographic techniques. Speciation. X-ray fluorescence. Polymers for construction chemicals. Analysis of the main component and impurities. Analysis of the air. Analysis of the water. Analysis of the fuel. Analysis of the lubricants. Analysis of steel. Analysis of aggregate, cement and other building materials. Analysis of the wood. Analysis of the glass. Analysis of the asphalt. Analysis of the paints and varnishes. Nanotechnology - an innovative building chemistry. Building Materials in accordance with sustainable development. Ecological solutions. TUTORIALS LABORATORY 1. Quantitative determination of PAH concentrations in mixtures of tar substances emitted during the thermal plasticization of bitumen 2. Analysis of dyes in polymeric materials. 3. Analysis of metal content in cement (white and gray). 4. Analysis of compounds emitted into indoor air: passive dosimetry and dynamic techniques. 5. Determine the type of polymer on the basis of its solubility. 6. Identification and quantitative analysis of the preservative (permetyrynu) applied to wood by HPLC. 7. Study the contents of CaO and MgO, CO₂ and moisture in the lime (hydrated, slaked) 8. Determination of residual solvents in the wastewater. 9. A trip to the cement, "Cement Wejherowo" Ltd., Manufacturer of white portland cement. PROJECT SEMINAR 1. The chemical composition of gypsum plaster and newly located and the old. 2. Polymeric materials in water and their impact on the quality of water supplied. 3. Influence of physico-chemical factors on the formation of sustainable and effective waterproofing materials. 4. Bitumen and bitumen in the coatings solvents papowych. 5. Industrial flooring. 6. Binders lime and limestone products in the binder. The role of hydrated lime. 7. Dyes for polymeric materials. 8. Biocides to protect wood. 9. Benefits for humans and the environment arising from the use of steel in construction. 10. Environmental aspects in the design of glass facades 11. The future of concrete in terms of sustainable development. 12. Indoor air pollution in various indoor areas. 13. Passive and dynamic methods used to analyze the volatile pollutants indoors. 14. Chemical analysis of effluent from a cement plant. 15. Air and water pollution (surface and groundwater) emitted as a result of LOTOS in Gdansk. Waste management.</p>		
Prerequisites and co-requisites	Basic knowledge of analytical, inorganic and organic chemistry		
Assessment methods and criteria	Subject passing criteria	Passing threshold	Percentage of the final grade
	Laboratory: average from the tests at the beginning of laboratories	60.0%	20.0%
	Grade from presentation and activity during seminars	60.0%	20.0%
	Lecture: written exam	60.0%	60.0%
