

Subject card

Subject name and code	Installations of Ship Engine Room, PG_00045111						
Field of study	Ocean Engineering, Ocean Engineering						
Date of commencement of studies	October 2020		Academic year of realisation of subject		2022/2023		
Education level	first-cycle studies		Subject group				
Mode of study	Full-time studies		Mode of delivery		at the university		
Year of study	3		Language of instruction		Polish		
Semester of study	6		ECTS credits		3.0		
Learning profile	general academic profile		Assessment form		assessment		
Conducting unit	Institute of Ocean Engineering and Ship Technology -> Faculty of Mechanical Engineering and Ship Technology						
Name and surname of lecturer (lecturers)	Subject supervisor		dr inż. Jacek Rudnicki				
	Teachers		dr inż. Jacek Rudnicki				
Lesson types and methods of instruction	Lesson type	Lecture	Tutorial	Laboratory	Project	Seminar	SUM
	Number of study hours	30.0	15.0	0.0	0.0	0.0	45
	E-learning hours included: 0.0						
Learning activity and number of study hours	Learning activity	Participation in didactic classes included in study plan		Participation in consultation hours		Self-study	SUM
	Number of study hours	45		6.5		23.5	75
Subject objectives	To teach systematic approach to problems of engine room piping systems. To familiarize with typical construction solutions and characteristics of the basic elements of the installation. To teach methods of calculations and selection of selected elements of piping systems.						
Learning outcomes	Course outcome		Subject outcome		Method of verification		
	[K6_U05] can formulate a simple engineering task and its specification within the range of design, construction and operation of ocean technology objects and systems		Draws block and schematic diagrams of the discussed installations. Calculates and selects main elements of the installation on the basis of technical documentation of engines and catalogs of factory ship devices.		[SU1] Assessment of task fulfilment [SU3] Assessment of ability to use knowledge gained from the subject		
	[K6_W05] has an organized knowledge on design, construction and operation of ocean technology objects and systems		Explains the general structure of typical solutions of engine room installations systems with diesel engines. Indicates the determinants classification determinants influencing structure of the installation.		[SW1] Assessment of factual knowledge		
	[K6_W06] has an organized knowledge on engineering methods and design tools allowing the conducting of projects within the construction and operation of ocean technology objects and systems		Describes the course of action in the calculation and selection of major components of a combustion engine room installation. Identifies the marine equipment market for the supply of major components and accessories of marine piping systems.		[SW1] Assessment of factual knowledge		
Subject contents	Lecture Basic knowledge of engine room piping systems - functions, design conditions, classification requirements, diagrams, CAD-CAM support. Tasks, general structure and typical construction solutions of selected engine room piping systems: cooling, fuel, lubricating oil, exhaust gas, compressed air, heating steam. Principles of selection and calculation of basic elements of selected piping systems. Auditorium exercises Calculation of flow resistance in pipelines of selected power systems - selection of pumps. Calculation and selection of: heat exchangers, fuel and lubricating oil separators, starting air compressors. Calculation and selection of exhaust gas system components.						

Prerequisites and co-requisites	Knowledge of the subject Internal combustion engines, Thermodynamics, Pumps and compressors, Boilers and heat exchangers.		
Assessment methods and criteria	Subject passing criteria	Passing threshold	Percentage of the final grade
	Midterm colloquium - lecture	51.0%	70.0%
	Midterm colloquium - exercise	51.0%	30.0%

<p>Example issues/ example questions/ tasks being completed</p>	<p>Lecture</p> <ol style="list-style-type: none"> 1. Present the algorithm for the selection of the heavy fuel heater for low-speed main drive engines the necessary input data, calculation scheme, output values. 2. Draw and discuss the block diagram of the high temperature circuit (HT) of the cooling water of the low-speed engine cylinders, indicating how to incorporate the evaporator and preheat engine into this system (only the solution with connected HT and LT circuits). 3. Draw and discuss the schematic diagram of the fuel supply system (from the service tank) of the main drive Diesel engine operating with heavy fuel. 4. Draw and describe the flowchart of the continuous and periodic purification system of circulating oil explain the differences in the functioning of the systems. <p>Auditorium exercises</p> <ol style="list-style-type: none"> 1. If the max. permissible flow velocity of the cooling water in the pipeline is $xx \text{ m/s}$ and the required flow rate is $yy \text{ m}^3/\text{h}$, the medium pressure is $zz \text{ bar}$ and its max. permissible temperature is $vv \text{ }^\circ\text{C}$, this means that the minimum internal diameter of the pipeline should be approx. \dots [mm]. 2. Calculate the heat transfer surface of a shell-and-tube cooler or alternatively a plate cooler in a freshwater system cooling the cylinders if the cooler is to dissipate heat $Q = xx$ and the freshwater volume flows $V1 = yy$ and central water $V2 = zz$ are known. Consider parallel configuration of oil and cylinder water coolers and tropical design conditions.
<p>Work placement</p>	<p>Not applicable</p>
