

Subject card

Subject name and code	Optimization Methods, PG_00057475						
Field of study	Automation, Robotics and Control Systems						
Date of commencement of studies	February 2023	Academic year of realisation of subject			2022/2023		
Education level	second-cycle studies	Subject group					
Mode of study	Full-time studies	Mode of delivery			at the university		
Year of study	1	Language of instruction			Polish		
Semester of study	1	ECTS credits			5.0		
Learning profile	general academic profile	Assessment form			exam		
Conducting unit	Department of Control Engineering -> Faculty of Electrical and Control Engineering						
Name and surname of lecturer (lecturers)	Subject supervisor	dr hab. Anna Witkowska					
	Teachers	dr hab. Anna Witkowska dr inż. Krzysztof Armiński					
Lesson types and methods of instruction	Lesson type	Lecture	Tutorial	Laboratory	Project	Seminar	SUM
	Number of study hours	30.0	0.0	15.0	15.0	0.0	60
	E-learning hours included: 0.0						
	Address on the e-learning platform: https://enauczanie.pg.edu.pl/moodle/course/view.php?id=16631						
	Additional information: Lecture - online/remote working Laboratory and Project - stationary/ at the building room						
Learning activity and number of study hours	Learning activity	Participation in didactic classes included in study plan	Participation in consultation hours	Self-study	SUM		
	Number of study hours	60	10.0	55.0	125		
Subject objectives	The aim of the course is to familiarize students with numerical optimization algorithms and prepare them to solve optimization problems independently, using computer software.						
Learning outcomes	Course outcome	Subject outcome			Method of verification		
	K7_W04	Students gain skills in formulating optimization tasks, building mathematical models of the optimized task. Students are able to evaluate and correctly interpret the obtained solutions			[SW1] Assessment of factual knowledge		
	K7_K06	Students know and can select an appropriate method and algorithm to solve optimization tasks for advanced problems in engineering practice.			[SK5] Assessment of ability to solve problems that arise in practice		
	K7_U07	Students know and can select an appropriate optimization method and algorithm for advanced problems in engineering practice			[SU1] Assessment of task fulfilment [SU3] Assessment of ability to use knowledge gained from the subject [SU4] Assessment of ability to use methods and tools		
K7_W14	Students will be familiar with analytical and numerical algorithms for solving optimization tasks; they will be able to determine the objective function, decision variables, constraints, and boundary conditions.			[SW1] Assessment of factual knowledge			

Subject contents	<p>Basics of optimization, repetition of the scope of 1st degree studies. Introduction to Matlab Optimization Toolbox. Numerical optimization methods, classification of optimization methods. Algorithms for finding the minimum function of one variable (Fibonacci, golden ratio,). The method of least squares and MiniMax in optimization tasks. Non-gradient methods (including Nelder Mead, Powell). Gradient methods of improvement directions. Methods of conjugate directions. Problems of non-linear programming with limitations. Direct and indirect methods. Random search. Sequential linear programming. Transformation technique. Methods of the penalty function. Multicriteria and methods of searching for solutions for multicriteria optimization problems (including Metakryterium, Pareto). Random search - Genetic algorithms, formic and swarm algorithms. Solving complex optimization problems - static and dynamic. Problem of dynamic positioning of the ship. Methods of optimal allocation of forces in issues of dynamic positioning of a ship (direct, indirect, numerical methods of optimal allocation, predictive method).</p> <p>The issues to be carried out will be accompanied by examples of the use of known methods to optimize the control system, including tuning of regulators, identification of the control object (eg optimization of PID controller parameters, identification of ship model parameters).</p>		
Prerequisites and co-requisites	Ability to mathematically describe physical and technical processes. Knowledge of the fundamentals of Mathematics and Optimization.		
Assessment methods and criteria	Subject passing criteria	Passing threshold	Percentage of the final grade
	project	50.0%	30.0%
	laboratory	50.0%	30.0%
	egzam	50.0%	40.0%

Example issues/ example questions/ tasks being completed	<ol style="list-style-type: none"> 1. Find the conditional minimum of function f by using the method of penalty function. 2. Optimize the parameters of PID controller, using the MNK, MiniMax or AG method for selected control system. 3. Select parameters of the nonlinear function f, based on the measured inputs and outputs data, by using matlab tools. 		
Work placement	Not applicable
