

Subject card

Subject name and code	Urban catchment hydrology, PG_00059948						
Field of study	Environmental Engineering						
Date of commencement of studies	February 2023	Academic year of realisation of subject			2022/2023		
Education level	second-cycle studies	Subject group			Optional subject group Subject group related to scientific research in the field of study		
Mode of study	Full-time studies	Mode of delivery			at the university		
Year of study	1	Language of instruction			Polish		
Semester of study	1	ECTS credits			4.0		
Learning profile	general academic profile	Assessment form			exam		
Conducting unit	Department of Geotechnical and Hydraulic Engineering -> Faculty of Civil and Environmental Engineering						
Name and surname of lecturer (lecturers)	Subject supervisor	dr hab. inż. Katarzyna Weinerowska-Bords					
	Teachers	dr hab. inż. Katarzyna Weinerowska-Bords					
Lesson types and methods of instruction	Lesson type	Lecture	Tutorial	Laboratory	Project	Seminar	SUM
	Number of study hours	30.0	15.0	0.0	15.0	0.0	60
	E-learning hours included: 0.0						
	Additional information: A supporting e-course on the e-Nauczanie platform has been prepared for the course: https://enauczanie.pg.edu.pl/moodle/course/view.php?id=25177						
Learning activity and number of study hours	Learning activity	Participation in didactic classes included in study plan		Participation in consultation hours		Self-study	SUM
	Number of study hours	60		5.0		48.0	113
Subject objectives	Recognizing and understanding the problems of the impact of urbanization on hydrological processes and the formation of runoff from the catchment. Ability to select and apply computational methods and tools. Understanding the relationship between the type, scale and rank of the problem and the method of solution and the required accuracy of calculations. Understanding of non-technical aspects affecting the work of an engineer. Developing the skills of critical evaluation of analyzes Sensitization to engineering mindfulness.						

Learning outcomes	Course outcome	Subject outcome	Method of verification
	K7_U06	Student can determine the amount of rainwater in catchment runoff. Student can assess the capacity of existing channels. Student can select and adjust computational methods to runoff calculation in the analyzed case. Evaluates the influence of the choice of the method and computational simplifications on the efficiency and accuracy of the solution.	[SU4] Assessment of ability to use methods and tools [SU2] Assessment of ability to analyse information [SU3] Assessment of ability to use knowledge gained from the subject [SU1] Assessment of task fulfilment
	K7_W09	Student has in-depth knowledge of the mathematical description of processes conditioning the outflow of urbanized basins. Student knows simplified and more complex methods for determining the outflow from the catchment. Recognizes and understands the non-technical aspects of engineering activities in determining the outflow of rainwater from the urbanized basin.	[SW1] Assessment of factual knowledge
	K7_W06	Student has in-depth knowledge of the correct selection of parameters and methods of calculating the flow in the network of open channels. He knows the engineering tool supporting calculations of unsteady flow in a network of channels or stormwater sewers/collectors.	[SW1] Assessment of factual knowledge
K7_U03	Student is able to prepare reports on the analyzes of the amount of stormwater requiring management in the catchment area. Student is able to select and present the key results of calculations, interpret them and draw conclusions.	[SU5] Assessment of ability to present the results of task [SU2] Assessment of ability to analyse information	
Subject contents	<p>Lecture: Hydrological cycle in a natural and urbanized catchment. Processes determining the formation of runoff from the catchment. Urbanized catchment and its specificity. Definition of the "rain-runoff" model and classification of models used in calculations supporting design. Physical and geographical characteristics of the catchment and their influence on the formation of the outflow from the catchment. Rain as the basic factor determining runoff from the catchment. Precipitation formulas. The concentration time of runoff from a catchment - definition, methods of determination and role in runoff calculations. Global and integrated catchment runoff modeling. Synthetic hyetograms. Methods of determination of effective precipitation. Conceptual and hydrodynamic models of surface runoff and channel flow. Fundamentals of applying HEC-HMS software. Tutorials: practical aspects of determining the parameters and calculating runoff from the catchment. Exercises in determining selected catchment characteristics. Calculation of the runoff concentration time from the catchment, selection of the authoritative rain, the use of global models to determine the culminating value of the runoff intensity and the amount of rainwater to be managed in the catchment. Project: catchment analysis and calculations of the amount of rainwater using two types of models - global and integrated. Practical applying HEC-HMS software. Comparison of results. Discussion of the impact of simplifications on the obtained calculation results.</p>		
Prerequisites and co-requisites	Basic knowledge of hydrology and simple methods of calculating the design discharge in a stormwater drainage system is required.		
Assessment methods and criteria	Subject passing criteria	Passing threshold	Percentage of the final grade
	Project - final test	60.0%	17.5%
	Tutorials (exercises)	70.0%	10.0%
	Tutorials - final test	60.0%	25.0%
	Final exam (lectures, theory)	60.0%	30.0%
Project - tasks and reports	100.0%	17.5%

Example issues/ example questions/ tasks being completed	<p>1. Explain the impact of urbanization processes on the course of a selected hydrological process in urban areas (e.g. infiltration, interception)</p> <p>2. Explain the term of time of runoff concentration and its role in hydrological calculations.</p> <p>3. Determine the the time of runoff concentration in the analyzed area.</p> <p>4. Using the rational method, determine the peak value of the outflow rate from the selected area.</p> <p>5. Explain the role (in the hydrological context) of the lag coefficient in the method of constant rainfall rates.</p>
