|   | Number of study hours  | 25  | 3.0                                 |                                       | 52.0   |         | 80  |
| Subject objectives                          | Mastering the basics of mathematical modeling and basic numerical techniques used in sanitary engineering. Practical aspects of modeling in sanitary engineering.  |   |                                     |                                       |  |         |     |
| Learning outcomes                           | Course outcome   | Subject outcome   |                                     |                                       | Method of verification   |         |     |
|   | [K7_U05] can rely on scientific sources for modern methods and technologies, and propose trends in the development of methods and rules for acquiring, filtering, processing and analyzing data  | The student is able to obtain information on the development of numerical methods used in sanitary engineering. He knows the practical aspect of their use.                                   |                                     |                                       | [SU2] Assessment of ability to analyse information<br>[SU4] Assessment of ability to use methods and tools |         |     |
|   | K7_U06   | Student is able to formulate a problem in the field of mathematical description of the phenomenon and select the appropriate numerical or analytical methods to solve it on a practical level |                                     |                                       | [SU2] Assessment of ability to analyse information<br>[SU4] Assessment of ability to use methods and tools |         |     |
|   | [K7_W12] has knowledge of contemporary and useful principles on data acquisition, filtration, processing and analysis  | The student is able to obtain information on the development of numerical methods used in sanitary engineering and is able to apply them in practice.   |                                     |                                       | [SW1] Assessment of factual knowledge  |         |     |
| K7_W01                                      | The student formulates the problem of solving differential equations with ordinary and partial derivatives describing selected problems in the field of sanitary engineering. It describes the solution of an engineering problem using a structural algorithm. Uses basic numerical methods to solve problems. He knows how to take into account practical aspects at this stage of modeling. |   |                                     | [SW1] Assessment of factual knowledge |  |         |     |

| Subject contents   | <p>LECTURE</p> <p>Solving systems of algebraic linear equations. Methods for solving nonlinear equations and systems of nonlinear equations. Interpolation and approximation. Solving ordinary differential equations: initial problem and boundary problem. Methods of numerical solution of the initial problem: single-step methods, explicit and implicit multi-step methods. Solving systems of ordinary differential equations. Solving differential equations with partial derivatives. Classification of equations. Formulating a problem solution. Finite difference method, approximation of first and second order derivatives.</p> <p>LABORATORY</p> <p>Solving ordinary differential equations describing selected issues in the field of sanitary engineering. Practical aspect of modeling - simulation of rainwater outflow in the HEC-RAS program</p> |   |  |                          |                   |                               |  |       |       |  |       |       |
