

Subject card

Subject name and code	Theory of Elasticity and Plasticity, PG_00044329						
Field of study	Civil Engineering						
Date of commencement of studies	October 2023	Academic year of realisation of subject			2024/2025		
Education level	second-cycle studies	Subject group			Optional subject group		
Mode of study	Part-time studies	Mode of delivery			at the university		
Year of study	2	Language of instruction			Polish		
Semester of study	3	ECTS credits			3.0		
Learning profile	general academic profile	Assessment form			assessment		
Conducting unit	Structural Mechanics Department -> Faculty of Civil and Environmental Engineering						
Name and surname of lecturer (lecturers)	Subject supervisor		dr inż. Marek Skowronek				
	Teachers						
Lesson types and methods of instruction	Lesson type	Lecture	Tutorial	Laboratory	Project	Seminar	SUM
	Number of study hours	10.0	10.0	0.0	0.0	0.0	20
	E-learning hours included: 0.0						
Learning activity and number of study hours	Learning activity	Participation in didactic classes included in study plan		Participation in consultation hours		Self-study	SUM
	Number of study hours	20		5.0		50.0	75
Subject objectives	Fundamentals of 2D and 3D system analysis. Classification of governing equations of material continuum. Selected analytical methods of 2D systems. Review of yield criteria						
Learning outcomes	Course outcome	Subject outcome			Method of verification		
	[K7_U03] can perform classic statical and dynamical analysis of rod structures stability (trusses, frames and ties), both statically determined and undetermined as well as surface structures (plates, membranes and shells)	The student conducts classical static, dynamic and stability analysis of bar structures (trusses, frames and cables), including statically determinate and indeterminate, 2D structures (plane stress, plates at bending, shells, membranes). The student identifies the 2D problem and performs relevant analytical solution					
	[K7_W03] knows basics of Continuum Mechanics, knows rules of static analysis, stability and dynamics of complex rod, shell and volume structures, both in linear and basic nonlinear regime	The student is familiar with solid body mechanics, recognizes the analytical fundamentals of static, dynamic and stability analysis of bar, 2D and 3D structures. The student resembles elastic and elastic-plastic performance of 2D structural cases					
	[K7_U06] is able to choose proper tools (measuring, analytical or numerical) to solve engineering problems, to acquire, filtrate, proces and analyse data	The student selects the tools (analytical or numerical) to solve engineering problems. The student takes a fundamental analytical background of bar and 2D structures.					
	[K7_W04] has knowledge on advanced strength of materials, modeling and optimisation of materials and constructions; has knowledge of fundamentals of Finite Element Method and general nonlinear analysis of engineering constructions and systems	The student takes fundamentals on advanced topics of mechanics of materials, material and structural modelling, FEM theoretical background and general approach to nonlinear engineering problems. The student analyses ultimate, yield-related limit states in two-dimensional problems					

Subject contents	Tensor algebra and analysis. Geometric and stress description of a solid body, material equations. Plate theory preliminaries. Introduction to plasticity theory. The two-dimensional problems, the Airy stress function in Cartesian and polar systems, axisymmetric cases. Plate examples - plate strip, axisymmetric cases. Safety margin in complex stress cases.		
Prerequisites and co-requisites	Structural mechanics, mathematics		
Assessment methods and criteria	Subject passing criteria	Passing threshold	Percentage of the final grade
	test	60.0%	100.0%
