

Subject card

Subject name and code	Two-dimensional structures and reliability of engineering structures, PG_00044333						
Field of study	Civil Engineering						
Date of commencement of studies	October 2023	Academic year of realisation of subject			2024/2025		
Education level	second-cycle studies	Subject group			Optional subject group Subject group related to scientific research in the field of study		
Mode of study	Part-time studies	Mode of delivery			at the university		
Year of study	2	Language of instruction			Polish		
Semester of study	4	ECTS credits			3.0		
Learning profile	general academic profile	Assessment form			exam		
Conducting unit	Structural Mechanics Department -> Faculty of Civil and Environmental Engineering						
Name and surname of lecturer (lecturers)	Subject supervisor	dr inż. Marek Skowronek					
	Teachers						
Lesson types and methods of instruction	Lesson type	Lecture	Tutorial	Laboratory	Project	Seminar	SUM
	Number of study hours	10.0	10.0	0.0	0.0	0.0	20
	E-learning hours included: 0.0						
Learning activity and number of study hours	Learning activity	Participation in didactic classes included in study plan		Participation in consultation hours		Self-study	SUM
	Number of study hours	20		7.0		48.0	75
Subject objectives	2D structures: theoretical background and analytical examples of 2D structures in Cartesian and polar systems Reliability of engineering structures: uncertainty analysis in civil engineering, defining basic random variables of selected problems, reliability definition, three levels of reliability assessment, random approach to loads and resistances, examples of structural reliability assessment						

Learning outcomes	Course outcome	Subject outcome	Method of verification
	[K7_W04] has knowledge on advanced strength of materials, modeling and optimisation of materials and constructions; has knowledge of fundamentals of Finite Element Method and general nonlinear analysis of engineering constructions and systems	The student shows a background on structural modelling	
	[K7_U11] is able to plan and execute laboratory experiments to evaluate quality of construction materials and to determine strength of construction elements	The student recognizes the estimation methods essential in engineering process	
	[K7_U03] can perform classic statical and dynamical analysis of rod structures stability (trusses, frames and ties), both statically determined and undetermined as well as surface structures (plates, membranes and shells)	The student is able to analyze selected structural types under external actions	
	[K7_W03] knows basics of Continuum Mechanics, knows rules of static analysis, stability and dynamics of complex rod, shell and volume structures, both in linear and basic nonlinear regime	The student recognizes and identifies the 2D Continuum Mechanics models	
	[K7_W16] knows methods of diagnostics of engineering objects, has knowledge about different kinds of defects in constructions and its reasons; knows means of fixing and reinforcing of constructions.	The student identifies structural work of various construction types	
Subject contents	<p>2D structures:</p> <ul style="list-style-type: none"> * theoretical background on 2D structures - plane stress analysis in Cartesian and polar systems, Airy stress function * plates at bending - theory and examples <p>Reliability of engineering structures:</p> <ul style="list-style-type: none"> * basic random variables of a variety of structural problems, * definitions of reliability * three levels of reliability assessment, * random approach to loads and resistances, * examples of structural reliability assessment 		
Prerequisites and co-requisites	Engineering Mechanics, Structural Mechanics, Strength of Materials		
Assessment methods and criteria	Subject passing criteria	Passing threshold	Percentage of the final grade
	activity, including presentation	60.0%	20.0%
	test	60.0%	80.0%
Recommended reading	Basic literature	<ol style="list-style-type: none"> 1. Girkmann K.: Dźwigary powierzchniowe. Arkady, Warszawa 1957, tłumaczenie R. Dąbrowski. 2.
