

Subject card

Subject name and code	, PG_00053422						
Field of study	Automation, Robotics and Control Systems						
Date of commencement of studies	October 2020		Academic year of realisation of subject		2023/2024		
Education level	first-cycle studies		Subject group				
Mode of study	Full-time studies		Mode of delivery		at the university		
Year of study	4		Language of instruction		Polish		
Semester of study	7		ECTS credits		3.0		
Learning profile	general academic profile		Assessment form		assessment		
Conducting unit	Department of Controlled Electric Drives -> Faculty of Electrical and Control Engineering						
Name and surname of lecturer (lecturers)	Subject supervisor		dr hab. inż. Marek Adamowicz				
	Teachers						
Lesson types and methods of instruction	Lesson type	Lecture	Tutorial	Laboratory	Project	Seminar	SUM
	Number of study hours	15.0	0.0	15.0	0.0	0.0	30
	E-learning hours included: 0.0						
Learning activity and number of study hours	Learning activity	Participation in didactic classes included in study plan		Participation in consultation hours		Self-study	SUM
	Number of study hours	30		5.0		40.0	75
Subject objectives	The aim of the course is to provide knowledge in the field of designing electric drive systems with adjustable speed electrical drives and power electronic voltage converters. Provide basic knowledge on calculations and methods of selecting the basic elements of drive systems: electric motor, gear and inverter, methods of selecting the basic components of the inverter: IGBT power module, diode rectifier, heat sink, DC link capacitor, motor filter and line filter. Presentation and discussion of life cycle issues, energy efficiency and energy quality in drive systems.						
Learning outcomes	Course outcome		Subject outcome		Method of verification		
	[K6_U03] can prepare and present a presentation on the problems and results of an engineering task		The student prepares and delivers a presentation regarding the issues and results of the completed engineering task.		[SU5] Assessment of ability to present the results of task		
	[K6_U01] can obtain information from literature, databases and other sources; integrate the information obtained, interpret it and draw conclusions, formulate and justify opinions		The student is able to use catalog data of power electronic components and understands the significance of basic parameters. They can utilize available simulation programs for confirming analyses and theoretical considerations.		[SU4] Assessment of ability to use methods and tools		
	[K6_W10] has basic knowledge related to mechatronics and robotics systems		The student possesses knowledge in the field of construction, design, and construction of mechatronics and robotics systems.		[SW3] Assessment of knowledge contained in written work and projects		
	[K6_W06] knows the structure of computers and microprocessors and the tasks of operating systems, has basic knowledge of the basics of computer software, drivers, microprocessor technology, design of simple algorithms and the operation of information networks		The student has knowledge in the field of designing and analyzing digital control systems for electric drives and power electronic converters		[SW3] Assessment of knowledge contained in written work and projects		

Subject contents	Lecture: 1) Calculations of drive systems - introduction. 2) Selection of electric motors for industrial drives, incl. fans, conveyor belts, cranes, etc. 3) Designing special propulsion systems: electric cars and electric bicycles, electric boats and electric planes. 4) Selection of auxiliary elements: clutches, brakes, speed sensors, torque sensors. 5) Energy-saving hybrid construction crane driving system. 6) Electric-combustion drives for power backup generators. 7) Selection of a mechanical transmission. 8) Selection of regulator settings in electric drive automatics systems. Laboratory: 1) Selection and analysis of fan drive system components, incl. using the Motor System Tool and Drivesize environment. 2) Selection and thermal analysis as well as loss analysis of the IGBT transistor module, diode bridge and heat sink, incl. using the IPOSIM environment. 3) Selection and analysis of DC intermediate circuit components: capacitor, braking resistor and pre-charge circuit. 4) Designing inverter filters. Design and analysis of the line filter and engine filter using the FEMM environment. 6) Analysis of the designed drive system in terms of energy quality. Simulation tests of the designed drive system using the LTSpice environment.		
Prerequisites and co-requisites	Knowledge of the subjects of electric machines, basics of automatics, power electronics.		
Assessment methods and criteria	Subject passing criteria	Passing threshold	Percentage of the final grade
	Test	60.0%	50.0%
	Laboratory	60.0%	50.0%
