

Subject card

Subject name and code	Real Time Systems, PG_00038097						
Field of study	Automation, Robotics and Control Systems						
Date of commencement of studies	October 2023		Academic year of realisation of subject		2024/2025		
Education level	first-cycle studies		Subject group				
Mode of study	Full-time studies		Mode of delivery		at the university		
Year of study	2		Language of instruction		Polish		
Semester of study	4		ECTS credits		4.0		
Learning profile	general academic profile		Assessment form		assessment		
Conducting unit	Katedra Inteligentnych Systemów Sterowania i Wspomagania Decyzji -> Faculty of Electrical and Control Engineering						
Name and surname of lecturer (lecturers)	Subject supervisor		dr inż. Tomasz Rutkowski				
	Teachers						
Lesson types and methods of instruction	Lesson type	Lecture	Tutorial	Laboratory	Project	Seminar	SUM
	Number of study hours	15.0	0.0	15.0	0.0	0.0	30
	E-learning hours included: 0.0						
Learning activity and number of study hours	Learning activity	Participation in didactic classes included in study plan		Participation in consultation hours		Self-study	SUM
	Number of study hours	30		4.0		66.0	100
Subject objectives	Acquiring basic knowledge in the field of real-time systems related to computer control systems. Getting to know selected implementations of real-time systems. Acquiring the ability to correctly use the known issues to design and implement control systems for the purposes of solving simple engineering tasks.						
Learning outcomes	Course outcome		Subject outcome		Method of verification		
	[K6_U05] can use analytical and simulation methods to solve tasks in the field of automation and robotics and use various techniques to carry out engineering tasks related to automation and robotics devices and systems		The student is able to use rapid prototyping and hardware loop simulation techniques to evaluate the performance of designed control systems. In a basic way, the student is able to use selected tools for programming AVR family microcontrollers, PLCs and Matlab/Simulink environment - toolboxes: Simulink Desktop Real-Time and StateFlow.		[SU5] Assessment of ability to present the results of task [SU4] Assessment of ability to use methods and tools [SU3] Assessment of ability to use knowledge gained from the subject [SU2] Assessment of ability to analyse information [SU1] Assessment of task fulfilment		
	[K6_W06] knows the structure of computers and microprocessors and the tasks of operating systems, has basic knowledge of the basics of computer software, drivers, microprocessor technology, design of simple algorithms and the operation of information networks		The student is able to define a real-time system. The student is able to classify real-time systems depending on the type of time boundaries considered. Identifies the role and place of real-time systems in computer control systems. Describes various types of digital control devices/platforms. Describes the architecture and explains the basic mechanisms of a real-time operating system.		[SW3] Assessment of knowledge contained in written work and projects [SW1] Assessment of factual knowledge		
	[K6_K02] can work in a group taking on different roles in it		The student is able to work individually and as part of a group in the implementation and verification of control systems using rapid-prototyping and hardware-in-the-loop simulation environments.		[SK2] Assessment of progress of work [SK1] Assessment of group work skills		

Subject contents	LECTURE History and basic definitions and issues related to real-time systems domain. Continuous systems versus discrete systems. Differential equation versus difference equation. Examples of real-time systems: microcontrollers, DSP, FPGA, PLC/PAC, industrial computers. Structure of classical and distributed control system. Real-time systems in computer control systems, examples of: industrial networks, digital control devices, industrial databases. Structure, functioning and programming of real-time systems examples: PLC/PAC controllers, Matlab/Simulink Desktop Real-Time. Rapid prototyping idea and tools. Hardware in the loop simulation idea. A finite state machine modelling using the StateFlow Matlab/Simulink toolbox. Features, architecture and fundamental elements of real-time operating systems. Selected real-time operating systems characteristics, including: QNX, RTLinux, VxWorks, Azure RTOS, Nut/OS, FreeRTOS. TRAINING LABORATORY Introduction to PLC controllers: configuration, programming, basic control algorithms implementation. Introduction to Matlab/Simulink (Desktop Real-Time and StateFlow toolboxes): configuration, basics of programming, basic mathematical models of control systems implementation and/or control algorithms implementation (rapid prototyping). Simulation analysis with hardware in the loop simulation technique. Design and implementation of a control algorithm for the autonomic mobile robot.		
Prerequisites and co-requisites	Knowledge of subjects: Computer Science (0411200011) and Basics of Automatics (0411200017)		
Assessment methods and criteria	Subject passing criteria	Passing threshold	Percentage of the final grade
	Laboratory exercise reports	50.0%	50.0%
	Lecture test	50.0%	50.0%

	eResources addresses	Adresy na platformie eNauczanie:	
Example issues/ example questions/ tasks being completed	[1] Define the real time system. [2] Describe classification of the real time systems according to various time constrains types. [3] Describe role and place of real time systems in the computer control systems. [4] Describe similarities and differences between rapid control prototyping and hardware in the loop simulation techniques. [5] Describe basic architectures of real time operating systems.		
Work placement	Not applicable
