

。 GDAŃSK UNIVERSITY OF TECHNOLOGY

Subject card

Subject name and code	MODELLING OF TRANSPORT PROCESSES, PG_00045922							
Field of study	Transport							
Date of commencement of studies	February 2024		Academic year of realisation of subject			2023/2024		
ducation level second-cycle studies		i	Subject group			Obligatory subject group in the field of study		
						Subject group related to scientific research in the field of study		
Mode of study	Full-time studies		Mode of delivery			at the university		
Year of study	1		Language of instruction			Polish		
Semester of study	1		ECTS credits			4.0		
Learning profile	general academic profile		Assessme	ent form		exam		
Conducting unit	Department of Transportation Engineering -> Faculty of Civil and Environmental Engineering							
Name and surname of lecturer (lecturers)	Subject supervisor		dr hab. inż. Jacek Oskarbski					
	Teachers		dr hab. inż. Jacek Oskarbski					
			mgr inż. Konrad Biszko					
Lesson types and methods of instruction	Lesson type	Lecture	Tutorial	Laboratory	Projec	t	Seminar	SUM
	Number of study hours	15.0	0.0	30.0	0.0	0.0 0.0		45
	E-learning hours included: 0.0							
Learning activity and number of study hours	Learning activity	Participation in didactic classes included in study plan		Participation in consultation hours		Self-study		SUM
	Number of study hours	45		10.0		45.0		100
Subject objectives	Solving transport issu mobile automats. Mo distributions of variab to describe the distrib a stochastic process,	delling and dep ples used in the pution of selected	endencies on description of ed parameters	the traffic flow the traffic proc	of vehic ess. Fur	les. Ba	sic character of probability	stics of random density used

Course outcome	Subject outcome	Method of verification				
[K7_U03] formulates research problems and selects appropriate analytical methods for their effective solution, using advanced IT tools, and critically evaluates the obtained results	The use of graph theory for modelling transport networks The use of freight task-sharing models and traffic distribution models in a transport network. Selection of tools for transport system analysis and evaluation depending on the type of model used. Selection of tools for transport system analysis and evaluation depending on the type of model used.	[SU3] Assessment of ability to use knowledge gained from the subject [SU4] Assessment of ability to use methods and tools				
[K7_K01] recognizes the importance of knowledge related to the field of study in solving cognitive and practical problems	Student can apply elements of statistical analysis and micro, macro and mesoscopic modelling in solving cognitive and practical problems related to transport systems.	[SK2] Assessment of progress of work [SK3] Assessment of ability to organize work [SK4] Assessment of communication skills, including language correctness [SK5] Assessment of ability to solve problems that arise in practice				
[K7_W01] identifies in an in-depth way phenomena related to the field of study as well as theories describing them and possible methods of analyzing processes occurring in the life cycle of technical systems	Solve issues related to modelling of transport processes using methods of systems of mass handling and elements of traffic theory applied to modelling transport systems.	[SW1] Assessment of factual knowledge [SW2] Assessment of knowledge contained in presentation				
[K7_W06] identifies reliable sources of information relevant to the analyzed issues		[SW1] Assessment of factual knowledge [SW2] Assessment of knowledge contained in presentation				
Transport system models. Arrangement of streams in transport networks. Surrounding the transport system. Forecasting the development of transport systems. Dynamics of transport processes. Definitions: mass handling system, railway network, transport network, transport process. Graphical representation of the transport network. Classification of mass handling systems. Operating disciplines. Division of railway systems. Non-branded handling systems. Transport process models - elements of the model, structure, traffic flows. Simulation models. Modelling and dependencies on the traffic flow of vehicles. Basic characteristics of random distributions of variables used in the description of the traffic process. Functions of probability density used to describe the distribution of selected parameters in the vehicle stream (free and nonfree traffic). Traffic as a stochastic, non-stationary process. Macroscopic and mesoscopic motion models - hydrodynamic analogy, wave model of motion, diffusion models (Pacey, Payne, Robertson, model with rectangular distribution of vehicle driving time), LWR model, Daganzo cellular model, cellular machines, event-based models. Microscopic models - driving models behind the leader (e.g. classic, stimulus response, psycho-spacing, fuzzy logic, psycho-phisical, Pipes linear, Bando, Gipps, SmartPath Simulation), lane change models, models of joining the traffic. Models of travel formation. Spatial distribution models. Models of division of transport tasks. Models of traffic distribution in the transport network. Packets of programs for modelling traffic in macro, meso and microscopic view.						
Knowledge of subjects transport systems, Traffic engineering						
Subject passing criteria	Passing threshold	Percentage of the final grade				
written exam	60.0%	60.0%				
tutorials	90.0%	40.0%
