GDAŃSK UNIVERSITY OF TECHNOLOGY

Subject card

Subject name and code	Theory of Elasticity and Plasticity, PG_00046464		
Field of study	Civil Engineering		
Date of commencement of studies	February 2024	Academic year of realisation of subject	2023/2024
Education level	second-cycle studies	Subject group	Obligatory subject group in the field of study Subject group related to scientific research in the field of study
Mode of study	Full-time studies	Mode of delivery	at the university
Year of study	1	Language of instruction	Polish
Semester of study	1	ECTS credits	5.0
Learning profile	general academic profile	Assessment form	exam
Conducting unit	Structural Mechanics Department -> Faculty of Civil and Environmental Engineering		
Name and surname of lecturer (lecturers)	Subject supervisor	prof. dr hab. inż. Jarosław Górski	
	Teachers	prof. dr hab. inż. Jarosław Górski dr inż. Marek Skowronek	

Lesson types and methods of instruction

Lesson type	Lecture	Tutorial	Laboratory	Project	Seminar	SUM
Number of study hours	30.0	30.0	0.0	0.0	0.0	60

E-learning hours included: 0.0

Learning activity and number of study hours

Learning activity	Participation in didactic classes included in study plan	Participation in consultation hours	Self-study	SUM
Number of study hours	60	5.0	60.0	125

Subject objectives

Determination of stresses, strains and deflections in 2D systems - plane stress, plates at bending
Choosing the appropriate computational method for a given problem, computational strategies
Determination of safety reserves due to plasticity in 2D and 3D stress states

Learning outcomes

Course outcome	Subject outcome	Method of verification
[K7_W04] has knowledge on advanced strength of materials, modeling and optimisation of materials and constructions; has knowledge of fundamentals of Finite Element Method and general nonlinear analysis of engineering constructions and systems	The student resembles the problems of solid body mechanics in the subject range	[SW1] Assessment of factual knowledge
[K7_U03] can perform classic statical and dynamical analysis of rod structures stability (trusses, frames and ties), both statically determined and undetermined as well as surface structures (plates, membranes and shells)	The student formulates and solves the problems of solid body mechanics in the subject range, points out practical application in the engineering structural domain	[SU1] Assessment of task fulfilment
[K7_U06] is able to choose proper tools (measuring, analytical or numerical) to solve engineering problems, to acquire, filtrate, proces and analyse data	The student selects the appropriate computational method according to the problem	[SU1] Assessment of task fulfilment
[K7_W03] has knowledge of Continuum Mechanics, knows rules of static analysis, stability and dynamics of complex rod, shell and volume structures, both in linear and basic nonlinear regime	The student resembles the problems of solid body mechanics in the subject range, is able to match the solid body mechanics domain to the practical engineering directions in structural design	[SW1] Assessment of factual knowledge

<table>
<tr><td>Subject contents</td><td colspan="3">Preliminaries. Assumptions and scope of theory of elasticity. Tensor calculus, Cartesian tensors, tensor algebra, differential operators, integral theorems. Plane stress and plane strain. Airy function in plane stress, plane stress solutions in Cartesian and polar coordinates. Kinematics of continuum, deformation tensors and strain tensors, compatibility conditions. Stress state, Cauchy stress tensor. Balance principles in the theory of
elasticity, groups of equations in the theory of elasticity. Constitutive laws, linearly elastic material, generalized
Hooke’s law, Lame and engineering constants, hyperelastic materials. Boundary problem of elasticity. Two-dimensional problem solution by means of Airy stress function - Cartesian and polar coordinate systems. Theory of thin elastic plates, kinematic assumptions, stresses and strains, equilibrium of a plate, boundary conditions, rectangular and circular plates – examples, plate strips. Elements of theory of plasticity.</td></tr>
