GDAŃSK UNIVERSITY OF TECHNOLOGY

Subject card

Subject name and code	Models in spatial development, PG_00053610					
Field of study	Spatial Development					
Date of commencement of studies	October 2022		Academic year of realisation of subject		2022/2023	
Education level	second-cycle studies		Subject group		Obligatory subject group in the field of study	
Mode of study	Full-time studies		Mode of delivery		at the university	
Year of study	1		Language of instruction		Polish	
Semester of study	2		ECTS credits		2.0	
Learning profile	general academic profile		Assessment form		assessment	
Conducting unit	Department of Urban Design and Regional Planning -> Faculty of Architecture					
Name and surname of lecturer (lecturers)	Subject supervisor		dr inż. Robert Skrzypczyński			
	Teachers					

Lesson types and methods of instruction	Lesson type	Lecture	Tutorial	Laboratory	Project	Seminar	SUM
	Number of study hours	30.0	0.0	0.0	0.0	0.0	30
	E-learning hours included: 0.0						

Learning activity and number of study hours	Learning activity	Participation in didactic classes included in study plan	Participation in consultation hours	Self-study	SUM
	Number of study hours	30	2.0	18.0	50

Subject objectives	To acquaint students with various types of models used in spatial management, methods of their creation and application.

Learning outcomes	Course outcome	Subject outcome	Method of verification
	K7_U04	Student can choose a quantitative model based on digitized tools, which is appropriate to the task related to spatial planning and identified spatial conditions	[SU1] Assessment of task fulfilment [SU4] Assessment of ability to use methods and tools
	K7_U02	Student indicates the place and method of applying models in the process of planning cities and regions	[SU2] Assessment of ability to analyse information

Subject contents	1. The concept and types of models and their role. 2. Iconographic and descriptive (ideological, conceptual) models concerning cities historical and contemporary. 3. Models in urban, region and country planning - creation and application. 4. Models of tourism development. 5. Systemic views of cities and other social territorial systems. 6. Population models. 7. Partial and comprehensive quantitative models (mathematical and simulation models of cities): model classifications, Lowry model, models: gravity, flow, Land-Use Transportation Interactions (LUTI), cellular automata, Agent-Based Models, microsimulation models. The paradigm of Zipser spatial decisions, ORION. Predictive models based on machine learning tools and neural networks. 8. Data sources applicable for quantitative models. 9. Models of regional growth. 10. Spatial processes, selected theories of spatial management - model approaches. 11. City control models. 12. Application of models in scenarios. 13. Applicability of quantitative models in the planning practice - the example of "smart city" and "resilient city" 14. Classical theories of urban analysis in quantitative big data based-models.
Prerequisites and co-requisites	

Assessment methods and criteria	Subject passing criteria	Passing threshold	Percentage of the final grade
	Activity during lectures - tests (quizzes)	50.0%	20.0%
	Colloquium (test)	50.0%	80.0%

	eResources addresses	Adresy na platformie eNauczanie:

Example issues/ example questions/ tasks being completed	1. Types of models from the point of view of: the way of expressing reality / the goals of their construction 2. In which phases of the planning process the models can be used? 3. What can models refer to in designing the spatial structure of the city? 4. What submodels does the LUTI Model contain? 5. What data can supply quantitative models? 6. How big data can enhance the process of shaping cities? 7. How the "space syntax" methodology can be applicable in the planning practice? 8. List examples of the use of machine learning and neural networks as a tools helping to understand urbanization processes.
Work placement	Not applicable
