Subject card

Subject name and code	Computer-Controlled Systems II, PG_00064534					
Field of study	Automatic Control, Cybernetics and Robotics					
Date of commencement of studies	October 2024		Academic year of realisation of subject		2025/2026	
Education level	second-cycle studies		Subject group		Obligatory subject group in the field of study	
					Subject group related to scientific research in the field of study	
Mode of study	Full-time studies		Mode of delivery		at the university	
Year of study	2		Language of instruction		English	
Semester of study	3		ECTS credits		2.0	
Learning profile	general academic profile		Assessment form		assessment	
Conducting unit	Faculty of Electronics, Telecommunications and Informatics					
Name and surname of lecturer (lecturers)	Subject supervisor		dr inż. Marcin Pazio			
	Teachers		dr inż. Paweł Raczyński			

Lesson types and methods of instruction	Lesson type	Lecture	Tutorial	Laboratory	Project	Seminar	SUM
	Number of study hours	0.0	0.0	15.0	15.0	0.0	30
	E-learning hours included: 0.0						

Learning activity and number of study hours	Learning activity	Participation in didactic classes included in study plan	Participation in consultation hours	Self-study	SUM
	Number of study hours	30	4.0	16.0	50

Subject objectives	The aim of the course is to practice the skills to use computers for control with particular emphasis on practice in developing control software running in real time.

Learning outcomes	Course outcome	Subject outcome	Method of verification
	[K7_U08] while identifying and formulating engineering tasks specifications and solving these tasks, can: - apply analytical, simulation and experimental methods, - notice their systemic and non-technical aspects, - make a preliminary economic assessment of suggested solutions and engineering work	Student describes and put to use in practice the basic components of a computer system. Student describes and put to use in practice interfaces connecting computer system with controlled plant. Student describes and put to use in practice multiprocessor systems. Student describes and put to use in practice different types of interfaces and communication protocols. Student describes and knows how to use micro-controllers to control. Student describes and knows how to use it in practice some techniques for creating software for control systems. Student describes and put to use in practice real-time operating systems.	[SK5] Assessment of ability to solve problems that arise in practice [SK2] Assessment of progress of work
	[K7_U04] can apply knowledge of programming methods and techniques as well as select and apply appropriate programming methods and tools in computer software development or programming devices or controllers using microprocessors or programmable elements or systems specific to the field of study, making assessment and critical analysis of the prepared software as well as a synthesis and creative interpretation of information presented with it	The student is able to use the knowledge he/she has acquired in the field of programming methods and techniques and select and apply appropriate programming methods and tools in creating computer software or programming devices or controllers using microprocessors or programmable elements or systems, characteristic of a given field of study, evaluating and critically analyzing the software created, as well as synthesizing and creatively interpreting the information presented using it	[SU4] Assessment of ability to use methods and tools [SU1] Assessment of task fulfilment
	[K7_U07] can apply advanced methods of process and function support, specific to the field of study	Student describes and put to use in practice the basic components of a computer system. Student describes and put to use in practice interfaces connecting computer system with controlled plant. Student describes and put to use in practice multiprocessor systems. Student describes and put to use in practice different types of interfaces and communication protocols. Student describes and knows how to use micro-controllers to control. Student describes and knows how to use it in practice some techniques for creating software for control systems. Student describes and put to use in practice real-time operating systems.	[SK5] Assessment of ability to solve problems that arise in practice [SK2] Assessment of progress of work
	[K7_U03] can design, according to required specifications, and make a complex device, facility, system or carry out a process, specific to the field of study, using suitable methods, techniques, tools and materials, following engineering standards and norms, applying technologies specific to the field of study and experience gained in the professional engineering environment	Student can think systemically, can design, execute, and program a computer-controlled control system. He is able to diagnose it and assess the quality of the constructed system.	[SU1] Assessment of task fulfilment [SU3] Assessment of ability to use knowledge gained from the subject

Subject contents	The course includes 6 individual projects and their laboratory implementation. The topics:
	- The use of PLC and visualization system for controlling and monitoring the status of the elevator model
	- Job analysis and tuning digital servo
	- Usage of a PC computer and MatLab package for controlling the dynamic object as a model of the tethered helicopter
	- Use of C language and the PC to control the plant in real time
	- Use of assembly language, and a microcontroller to control the plant in real time
	- Usage of a PC computer for controlling the work stand which consists of the manipulator, and the measuring system and the transport
Prerequisites and co-requisites	No requirements

Assessment methods and criteria	Subject passing criteria	Passing threshold	Percentage of the final grade
	Documentation of completed projects	51.0%	40.0%
	Implementation of the project	51.0%	60.0%
