

## Subject card

Subject name and code	Optimization Methods, PG_00057475						
Field of study	Automation, Robotics and Control Systems						
Date of commencement of studies	February 2025		Academic year of realisation of subject		2024/2025		
Education level	second-cycle studies		Subject group				
Mode of study	Full-time studies		Mode of delivery		at the university		
Year of study	1		Language of instruction		Polish		
Semester of study	1		ECTS credits		5.0		
Learning profile	general academic profile		Assessment form		exam		
Conducting unit	Department of Control Engineering -> Faculty of Electrical and Control Engineering						
Name and surname of lecturer (lecturers)	Subject supervisor		dr hab. Anna Witkowska				
	Teachers		dr hab. Anna Witkowska  dr inż. Krzysztof Armiński				
Lesson types and methods of instruction	Lesson type	Lecture	Tutorial	Laboratory	Project	Seminar	SUM
	Number of study hours	30.0	0.0	15.0	15.0	0.0	60
	E-learning hours included: 0.0						
	Address on the e-learning platform: <a href="https://enauczanie.pg.edu.pl/moodle/course/view.php?id=16631">https://enauczanie.pg.edu.pl/moodle/course/view.php?id=16631</a>						
	Additional information: Lecture, exercises, laboratory - classes conducted in a stationary form  Lecture - conventional lecture, presentation of contents, discussion  Computer laboratories - realization of prepared tasks on a computer workstation.  Project - independent implementation of prepared algorithms in a selected programming environment (Matlab/Python )						
Learning activity and number of study hours	Learning activity	Participation in didactic classes included in study plan		Participation in consultation hours		Self-study	SUM
	Number of study hours	60		10.0		55.0	125
Subject objectives	The aim of the course is for the student to master the knowledge of numerical optimisation algorithms and their properties. During the course, the student will acquire the skills of independent implementation of algorithms, selection of parameters, and interpretation of the obtained solutions. These knowledge and skills will be applied to solving automation problems using Matlab software and the Python programming language.						
Learning outcomes	Course outcome		Subject outcome		Method of verification		
	[K7_W14] has knowledge of mathematical modelling, identification, optimisation, decision support decision-making and control, knows methods of implementing advanced control algorithms in industrial equipment		Designs control systems with optimal performance (e.g., minimizing control signals and regulation error). Implements a genetic algorithm for optimizing the control system.		[SW1] Assessment of factual knowledge		
	[K7_K06] is aware of the impact of engineering activities on the quality of applied solutions and the environment		Examines the quality of the obtained solutions, the impact of algorithms and their parameters on the occurrence of local and global extrema.		[SK2] Assessment of progress of work		
	[K7_U07] is able to use analytical, simulation and experimental methods to formulate and solve engineering tasks and simple research problems in the field of automation and robotics		Formulates a mathematical model of an optimization problem for selected engineering issues such as thrust allocation, controller parameter tuning, or object model parameter identification (using experimental data). Adapts and independently implements optimization algorithms using MATLAB and Python.		[SU1] Assessment of task fulfilment		

Subject contents	<p>A review and extension of topics covered in the course "Optimization and Decision Support" at the undergraduate level. Pareto Front Method. Introduction to Python. Discussion of Python's cvxpy library for convex optimization. Examples of optimization problems in Python.Iterative Algorithms for Unconstrained Optimization: Nelder-Mead method, conjugate gradients, Newton's methods. Examples of implementations in Matlab applied to problems such as measurement data approximation and parametric identification of a marine vessel model.Iterative Algorithms for Constrained Optimization.Direct Algorithms: Random search, sequential linear programming method.Indirect Algorithms: Variable transformation methods, penalty function methods (interior and exterior). Examples of Matlab implementations.Lagrange Method vs. Penalty Function Method: Comparison and applications.Randomized Optimization Algorithms: Monte Carlo method.Metaheuristic Optimization Algorithms:Implementation of a genetic algorithm for PID controller parameter tuning.Swarm intelligence algorithms, such as particle swarm optimization and ant colony optimization. Examples of applications to control system parameter tuning and finding optimal paths in a graph. Control allocation tasks in dynamic positioning systems for ships. Examples of Matlab implementations.Project Presentation and Evaluation: Includes theoretical background, results, and conclusions.</p> <p><b>Laboratory:</b> Study of the properties of selected numerical algorithms for nonlinear optimization based on prepared test problems in the Matlab environment. The considered test problems include a single-criterion problem for identifying an object model, a problem for tuning PID controller parameters in a control system. Minimization of test nonlinear functions with constraints is carried out using the penalty function method.</p>		
Prerequisites and co-requisites	Ability to mathematically describe physical and technical processes. Knowledge of the fundamentals of Mathematics, Numerical Methods, Modeling and Identification, Computer Control Systems, Optimization and decision support (within the scope of undergraduate studies). Fundamentals of programming in MATLAB/ SIMULINK, Python		
Assessment methods and criteria	Subject passing criteria	Passing threshold	Percentage of the final grade
	laboratory	50.0%	30.0%
	egzam	50.0%	40.0%
	project	50.0%	30.0%
