

。 GDAŃSK UNIVERSITY OF TECHNOLOGY

Subject card

Subject name and code	Complex concrete structures, PG_00041056							
Field of study	Civil Engineering							
Date of commencement of studies	February 2025		Academic year of realisation of subject			2024/2025		
Education level	second-cycle studies		Subject group			Obligatory subject group in the field of study		
						Subject group related to scientific research in the field of study		
Mode of study	Full-time studies		Mode of delivery			at the university		
Year of study	1		Language of instruction			English		
Semester of study	1		ECTS credits			4.0		
Learning profile	general academic profile		Assessment form			assessment		
Conducting unit	Department Of Engineering Structures -> Faculty Of Civil And Environmental Engineering -> Wydziały Politechniki Gdańskiej							
Name and surname of lecturer (lecturers)	Subject supervisor		dr inż. Patryk Ziółkowski					
	Teachers							
Lesson types and methods of instruction	Lesson type	Lecture	Tutorial	Laboratory	Projec	t	Seminar	SUM
	Number of study hours	30.0	15.0	0.0	15.0	0.0		60
	E-learning hours included: 0.0							
Learning activity and number of study hours	Learning activity	Participation in didactic classes included in study plan		Participation in consultation hours		Self-study		SUM
	Number of study hours	60		5.0		35.0		100
Subject objectives	The student knows the mechanical properties of concrete and steel. On the model adopted in the European standard, the student can determine the load-bearing capacity of the beams and cross-reinforced slabs. Student can dimension reinforcement for bending and shear and construct it. The student understands the necessity to calculate the serviceability limit state in reinforced concrete structures. The student also knows the dimensioning rules of reinforced concrete stairs, reinforced concrete deep-beams, reinforced concrete retaining walls, and reinforced concrete foundation slabs.							

Learning outcomes	Course outcome	Subject outcome	Method of verification				
	[K7_U02] can design and dimension complex steel, concrete (including reinforced), wood and masonry construtions and its details	The student is able to design and dimension complex reinforced concrete structures, including their elements and structural details, taking into account load-bearing capacity, serviceability, and durability in accordance with the requirements of Eurocode 2.	[SU1] Assessment of task fulfilment [SU3] Assessment of ability to use knowledge gained from the subject				
	[K7_W02] knows principles of analysis, design and dimensioning of complex constructions and its elements	The student knows the principles of static analysis, design, and dimensioning of complex reinforced concrete structures and their elements in accordance with the requirements of Eurocode 2.	[SW3] Assessment of knowledge contained in written work and projects				
	[K7_K01] is aware of necessity of professional competences improvement; obeys the professional ethics code	The student understands the need for continuous professional development in the field of reinforced concrete design and the importance of adhering to professional ethics in civil engineering practice.	[SK2] Assessment of progress of work [SK1] Assessment of group work skills				
	[K7_W09] knows advanced methods of building physics with applications in heat and moisture migration in buildings, energy demand for buildings and its acoustics	The student knows the principles of designing selected elements of reinforced concrete structures.	[SW3] Assessment of knowledge contained in written work and projects				
	[K7_W04] has knowledge on advanced strength of materials, modeling and optimisation of materials and constructions; has knowledge of fundamentals of Finite Element Method and general nonlinear analysis of engineering constructions and systems	The student knows and uses the standards from the Eurocode 2 series.	[SW1] Assessment of factual knowledge				
Subject contents	As part of this course, the following issues in the field of concrete structures will be discussed:						
	 Mechanical properties of concrete and reinforcing steel; Calculation of reinforced concrete cross-sections - bending; Calculation of reinforced concrete cross-sections - shear; Serviceability limit state in reinforced concrete structures; Reinforced concrete slabs, one-way and cross-reinforced; Reinforced concrete stairs; Reinforced concrete retaining walls; Reinforced concrete foundation slabs; Concrete structures of the future - current and future trends. 						
	As part of the course, students will participate in VR workshops (Virtual Concrete Structures Laboratory "Concrete VR Lab"). Students will also have access to a range of cutting-edge educational technologies, including: - a metaverse-based virtual space for meetings with other students and the instructor via the VRC application; - a tool for personalizing textual learning materials (based on their individual psychological profile); - a virtual AI assistant with speech recognition and synthesis capabilities, available through a dedicated VR-DOJO application.						
Prerequisites							
Assessment methods	Subject passing criteria	Passing threshold	Percentage of the final grade				
and criteria	Test	F assing uneshold	60.0%				
	Semester project with oral defense	60.0%	40.0%

Nagrodzka-Godycka, Testing the properties of concrete and reinforced concrete in laboratory conditions, Arkady, Warsaw 1999; Ł. Drobiec, R. Jasiński, A. Piekarczyk - Diagnostics of Reinforced Concrete structures, Methodology, Field tests, laboratory tests of concrete and steel, Polish Scientific Publishers PWN, vol. 1, 2010; PN-B-03264: 2002, Concrete, reinforced and prestressed structures. 			
	eResources addresses	Adresy na platformie eNauczanie: Complex Concrete Structures (CE) - 2024/2025 - Moodle ID: 29772 https://enauczanie.pg.edu.pl/moodle/course/view.php?id=29772			
Example issues/ example questions/ tasks being completed	 Explain the term: double-reinforced cross-section. Explain the consequences of concrete shrinkage in reinforced and prestressed concrete structures. Describe the general characteristics of reinforced concrete slabs one-way and cross-reinforced - explain essential differences. For cross-reinforced slabs, sketch the static diagrams for the design of the support beams. What condition must the spans mentioned above meet to treat the concrete slab as working in two directions? Influence of the ratio of height to the cross-sectional dimension of a concrete sample on its compressive strength. What is the guaranteed strength of concrete? At what confidence level it is determined? Describe the concept of mean, characteristic and computational strength of concrete in compression and tensile strength. 				
Work placement	Not applicable
