

## Subject card

Subject name and code	Basics of Mechanics, PG_00047526							
Field of study	Automatic Control, Cybernetics and Robotics							
Date of commencement of studies	October 2025		Academic year of realisation of subject		2026/2027			
Education level	first-cycle studies		Subject group		Obligatory subject group in the field of study			
						Subject group related to scientific research in the field of study		
Mode of study	Full-time studies		Mode of delivery		at the university			
Year of study	2		Language of instruction		Polish			
Semester of study	4		ECTS credits		3.0			
Learning profile	general academic profile		Assessment form		assessment			
Conducting unit	Department Of Mechanics And Mechatronics -> Faculty Of Mechanical Engineering And Ship Technology - > Wydziały Politechniki Gdańskiej							
Name and surname	Subject supervisor		dr hab. inż. Krzysztof Lipiński					
of lecturer (lecturers)	Teachers		dr hab. inż. K	inż. Krzysztof Lipiński				
Lesson types and methods	Lesson type	Lecture	Tutorial	Laboratory	Projec	:t	Seminar	SUM
of instruction	Number of study hours	30.0	15.0	0.0	0.0		0.0	45
	E-learning hours inclu	uded: 0.0						
Learning activity and number of study hours	Learning activity			Participation in consultation hours		Self-study		SUM
	Number of study hours	45		3.0		27.0		75
Subject objectives	To familiarize student theorems of statics. T know the stress-strain bending and torsion. statically determinable kinematics and dynar	The introduction n relationship, a Presentation of e and indeterm	n of methods for and the concept f methods of de inable systems	or modeling slid ots of allowable etermining the	ing fricti stress i stresses	ion and in tensil s and lir	rolling resist e elements, one deflection	ance. Get to compression, of beams, for

	[K6_W02] knows and understands, to an advanced extent, selected laws of physics and physical phenomena as well as methods and theories explaining the complex relationships between them, constituting the basic general knowledge in the field of technical sciences related to the field of study	Student prepares physical models of real objects. Student presents basic concepts, principia and laws of statics and kinematics. Student replaces constraints by reaction forces and torques. Student writes equilibrium conditions for concurrent planar systems of forces, he/she calculates reactions at the supporting points. Student writes equilibrium conditions for general planar systems of forces. Student determines friction forces for sliding friction, belt friction and rolling resistance. Student writes equilibrium conditions for concurrent spatial systems of forces. Student writes equilibrium conditions for general spatial systems of forces. Student determines gravity forces and coordinates of gravity centers. Student determines limit stresses for tension, compression, bending, torsion. Student determines diagrams of bending and torsion moments for beams. Student determines second moments of area of the beam cross-section. Student determines beams. Student determines deflection line for beams, he/she solves statically indeterminate beams. Student determines yield stresses in uniaxial tension for complex stress states. Student describes kinematics of a particle with use of different systems of coordinates. Student determines relations between position, velocity and acceleration of the particle. Student determines relations between position, velocity and acceleration of the particle. Student determines relations between velocities of different point of a rigid body. Student presents basic concepts, principia and laws of dynamics. Student determines inertia parameters of rigid bodies (statical problems referring to dynamics of particles. Student determines linear momentum and angular momentum of bodies. Student solves practical problems referring to dynamics of particles. Student evaluates work, power, kinematical energy and potential energy of bodies (statical moment, moments of inertia, inertia products). Student determines linear momentum of bodies. Student evaluates kinetic energy and potential energy of bodi	[SW1] Assessment of factual knowledge

	Course outcome	Subject outcome	Method of verification		
	[K6_U02] can perform tasks related to the field of study in an innovative way as well as solve complex and nontypical problems, applying knowledge of physics, in changing and not fully predictable conditions	Students solve elementary, non- typical and innovative problems of statics and kinematics Students solve elementary, non- typical and innovative problems of strength of materials: he determines stress and strain of simple deformable elements Students solve elementary, non- typical and innovative problems of dynamics of mechanical systems	[SU1] Assessment of task fulfilment [SU4] Assessment of ability to use methods and tools		
Subject contents	Information on the organization of the course. Bibliography. Historical overview. Mechanics and its main topics. Modeling in mechanics. Concepts of real object, physical model, mathematical model, algorithm. Concepts of rigid body, material particle, concentrated force. Newton's laws. Primitive notions and axioms. Equivalent systems of forces. Net force for a concurrent et of forces. Torque about a point and about an axis. Net force for a set of two parallel forces. A couple of forces and its torque. Net torque for a concurrent and general set of forces. Main net force and main net torque. Degrees of freedom, constraints, reactions. Statically determinable system of forces, statically undeterminable system of forces, mechanisms. Statics. Basic concepts. Equilibrium conditions for planar systems. Particular cases of systems and their equilibrium conditions: concurrent system so forces parallel system. Particular cases of systems and their equilibrium conditions: concurrent system so forces parallel system. Particular cases of systems and their equilibrium conditions: concurrent system so forces parallel system of forces. Alternative equilibrium conditions. Principle of independent actions of forces (principle of superposition). Origins of the forces: internal and external forces. Gravity forces and coordinates of the gravity centers. Static momentum of inertia. Sliding friction, belt friction, rolling resistance. Strain/stress characteristics. Limit stresses for tension, compression, bending, torsion, Hook law, Young modulus, termall stresses, factor of saferty. Diagrams of bending and torsion moments for beams. Secend moments of area of the beam cross-section. Deflection line for beams, statically indeterminate beams. Yield stresses in uniaxial tension for complex stress statees. Kinematics of a point: basic concepts and principles: position velocity acceleration, motion equations, trajectory. Description of the motion equations with Cartesian coordinates, polar coordinates, cylindrical coordinates, spherical c
