GDAŃSK UNIVERSITY OF TECHNOLOGY

Subject card

Subject name and code	Chemistry and technology of dispersed systems , PG_00065969		
Field of study	Green Technologies		
Date of commencement of studies	February 2026	Academic year of realisation of subject	2026/2027
Education level	second-cycle studies	Subject group	Optional subject group
Mode of study	Full-time studies	Mode of delivery	at the university
Year of study	1	Language of instruction	Polish -
Semester of study	2	ECTS credits	3.0
Learning profile	general academic profile	Assessment form	assessment
Conducting unit	Faculty of Chemistry -> Faculties of Gdańsk University of Technology		
Name and surname of lecturer (lecturers)	Subject supervisor	prof. dr hab. inż. Adam Macierzanka	
	Teachers		

Lesson types

Lesson type	Lecture	Tutorial	Laboratory	Project	Seminar	SUM
Number of study hours	15.0	0.0	30.0	0.0	0.0	45

E-learning hours included: 0.0

Learning activity and number of study hours

Learning activity	Participation in didactic classes included in study plan	Participation in consultation hours	Self-study	SUM
Number of study hours	45	5.0	25.0	75

Subject objectives

The aim of the course is to provide a broad but detailed introduction to chemistry and technology of dispersed systems and an overview of some theoretical developments, up-to-date experimental advances and current industrial applications, with an emphasis on green technologies.

This course will focus on the theories used in colloid science, their important applications and associated techniques.

Learning outcomes	Course outcome	Subject outcome	Method of verification
	[K7_K01] is aware of the problems related to the profession of engineer, is able to assess the effects of the activities performed	is ready to critically evaluate the applicability of mathematical and physical methods and models in the analysis of chemical phenomena and processes, and to responsibly apply his knowledge in solving research and technological problems, taking into account the need for collaboration and consultation when making decisions.	[SK5] Assessment of ability to solve problems that arise in practice
	[K7_W04] identifies chemical and biological threats to the environment, taking into account anthropogenic factors	has knowledge in the field of chemistry and technology of dispersed systems, which can be used to solve practical aspects of environmental protection and the use of green technologies.	[SW1] Assessment of factual knowledge
	[K7_W01] identifies problems and defines tasks in the field of environmental protection technologies and modern analytical methods	has the knowledge necessary to correctly identify problems in the field of chemistry and technology of dispersed systems.	[SW1] Assessment of factual knowledge
	[K7_U05] formulates and tests hypotheses related to engineering problems and simple research problems concerning environmental protection, the use of new environmental protection technologies and analytical procedures	is able to operate equipment used in the chemistry and technology of dispersed systems, taking into account both the theoretical and practical aspects of equipment used in green technologies.	[SU3] Assessment of ability to use knowledge gained from the subject [SU4] Assessment of ability to use methods and tools [SU2] Assessment of ability to analyse information

Subject contents	Course content – lecture **The lectures** will focus on the theories used in colloid science, their applications and associated measuring techniques: - Definition and classification of dispersed systems and preparation techniques (condensation and dispersion methods), - Different types of dispersed systems (foams, emulsions, microemulsions, aerosols, gels etc., characteristics of typical devices used to produce dispersed systems), - Interactions between molecules and in macroscopic systems (physical and specific interactions, structure and parameters of the double electric layer, mechanism of the surface charge formation, potential zeta, DVLO theory etc.), - Surface and interfacial tension, adsorption to interfaces (fundamentals of measuring techniques, wetting and contact angle phenomena etc.), - Fundamental characterisation and properties of surfactants (structure, classification, bio-surfactants, hydrophilic-lipophilic properties, HLB value, etc.), Course content – laboratory The course will also focus on the translation of theoretical knowledge to practical applications through **laboratory exercises**. The exercises will be preceded by short written tests relevant to particular exercises. The laboratory exercises will be organised in the Department of Fats and Detergents Technology. They will cover topics such as: - Determination of the hydrophilic-lipophilic properties of surfactants. - Influence of the phase ratio and the temperature on the emulsion type, the phase inversion and the stability of emulsion systems. - Microemulsions and methods for their preparation. - Determination of the critical micelle concentration (CMC) in aqueous solutions of surfactants. - Wettability and contact angle. - Examination of basic rheological properties of gels and emulsions. - Properties of dispersed systems used in everyday life.
Prerequisites and co-requisites	Basic knowledge of physical chemistry, chemical technology and biotechnology.
Assessment methods and criteria	

Subject passing criteria	Passing threshold	Percentage of the final grade
Lecture (written examination)	50.0%	60.0%
Laboratory practical exercises (attendance, written tests and exercise reports)	100.0%	40.0%
