

Subject card

Subject name and code	Computer-Controlled Systems I, PG_00048412						
Field of study	Automatic Control, Cybernetics and Robotics						
Date of commencement of studies	February 2027			Academic year of realisation of subject		2026/2027	
Education level	second-cycle studies			Subject group		Obligatory subject group in the field of study Subject group related to scientific research in the field of study	
Mode of study	Full-time studies			Mode of delivery		at the university	
Year of study	1			Language of instruction		Polish	
Semester of study	1			ECTS credits		3.0	
Learning profile	general academic profile			Assessment form		assessment	
Conducting unit	Department of Automatic Control -> Faculty of Electronics Telecommunications and Informatics -> Faculties of Gdańsk University of Technology						
Name and surname of lecturer (lecturers)	Subject supervisor			dr inż. Paweł Raczyński			
	Teachers			dr inż. Paweł Raczyński			
Lesson types	Lesson type	Lecture	Tutorial	Laboratory	Project	Seminar	SUM
	Number of study hours	30.0	0.0	0.0	0.0	0.0	30
	E-learning hours included: 0.0						
Learning activity and number of study hours	Learning activity	Participation in didactic classes included in study plan		Participation in consultation hours		Self-study	SUM
	Number of study hours	30		6.0		39.0	75
Subject objectives	The main aim of the course is to familiarize students with techniques of using computers to control and experience skill of computer control system architecture design and improvement of programming techniques to create control software working in real time.						
Learning outcomes	Course outcome		Subject outcome			Method of verification	
	[K7_W08] knows and understands, to an increased extent, the fundamental dilemmas of modern civilisation, the main development trends of scientific disciplines relevant to the field of education		Is aware of the interdisciplinary nature of the field of automation and is able to independently explore other fields of knowledge to the extent necessary to implement computer systems and software in these fields.			[SW1] Assessment of factual knowledge	
	[K7_W10] knows and understands, to an increased extent, the basic processes occurring in the life cycle of equipment, objects and technical systems, as well as methods of supporting processes and functions, specific to the field of study		Knows the life cycle of technical devices, knows methods of diagnosing technical systems and knows ways to increase the reliability of such systems.			[SW1] Assessment of factual knowledge	
	[K7_W04] knows and understands, to an increased extent, the principles, methods and techniques of programming and the principles of computer software development or programming devices or controllers using microprocessors or other elements or programmable devices specific to the field of study, and organization of work of systems using computers or such devices		He knows various programming languages, can create software that works directly with equipment operating in the time dependence regime. It can run and test such software.			[SW1] Assessment of factual knowledge	

Subject contents	<p>Course content – lecture</p> <p>1. Computer system controlled plant interfacing technique; simple interfacing and with both side acknowledgement; ideas, algorithms, acknowledgement passing. 2. Methods of acknowledgement passing: software checking and passing, using interrupt techniques, using readiness checking (ready wait lines). The best solution optimization criteria. 3. Examples of typical solutions using standard programmable input/output ports. 4. Different ways of interrupt handling in computer control systems, pooling, vectorized systems, centralized interrupt controllers and daisy-chain controllers. 5. Single level and multi level interrupt systems, arbitration of priority, mask modes and special mask modes, typical solutions. 6. Examples of implementing of interrupt system in computer control; interrupt latency estimation, system reaction time, density of interrupts and control computer efficiency. 7. Multi-processor and multi-computer systems architecture, requirements of increase in computing power over single processor systems possibilities. 8. Multi-processor and multi-computer systems buses, local and global resources, global resources administration. 9. Multi-processor bus standards: STE, MULTIBUS, VME PCI, COMPACT PCI. 10. Common resources access arbitration, examples of hardware and software arbiters, centralized and daisy-chain solutions, arbitration algorithms. 11. Arbitration methods examples. 12. Main processor coprocessor cooperation ideas. 13. Software techniques in common resources access control semaphores, access blockades. 14. Multi-computer systems, data exchange rules, hardware and software solutions, multi-computer systems architecture. 15. Interfacing techniques using DMA, hardware and software aspects of using DMA, interrupt driven contrary DMA data transfer. 16. Bus as a communication system between multi-users, communication protocols, hierarchy of communication protocols. 17. Hierarchy of communication protocols standards, 4 and 7 layer ISO models. 18. Communication protocol layers, bottom 4 layers specifications, protocol specification examples RS232, RS485, I2C and others. 19. Advantages and disadvantages of communication protocol standardization; decision criteria standard or dedicated solutions. 20. Hardware methods of communication interfaces reliability improvement; types and characteristics of different data transmission media; signal processing methods used for signal matching to media characteristics; different kinds of line transmitters and receivers. 21. Software methods of communication interfaces reliability improvement; Error detection codes and error correction codes. 22. Examples of bit-parallel and bit-serial protocols. 23. Communication protocol organization: bit-oriented, character counting protocols, character-controlled protocols; examples of standards. 24. Micro-controllers in control systems. 25. INTEL MCS-51 micro-controller family; basic model, resources and programming language. 26. Architecture and resources of some advanced MCS-51 family members offered by PHILIPS, DALLAS, MAXIM, Analog Devices and ATMEL. 27. Build-in micro-controller interfaces, real-time ports; hardware support for context-switching methods. 28. User interface hardware and software techniques; contacts interfacing keyboards; pointing and control input devices mouse, touch pads, joysticks and others. 29. Process status displaying techniques, numeric and alpha-numeric displays interfacing; CRT and LCD monitors interfacing, software problems in graphic displaying, graphic processors and accelerators. 30. Special memories used in control systems: FIFO and LIFO buffers, cyclic buffers, dual gated RAM memories. 31. Nonvolatile memories: battery supported RAM memories, FLASH memories with parallel and serial access, EEPROMS, software consequences of using nonvolatile memories. 32. Service less systems, service less system reliability increasing techniques; methods used for decreasing of power consumption in autonomous systems. 33. Analog inputs and outputs to computer interfacing; A/D and D/A converters; methods of conversion, its base parameters and application criteria; sample and hold circuits, extrapolators, PWM outputs, U/F converters. 34. PC type computer in control systems, industrial standards in PC compatible computers, modular computers. 35. Floppy and hard disk memories, organization and software interfacing; disk memories as an example of techniques of controlling of electromechanical device, methods used for reliability increasing; electromechanical clearance compensation. 36. Multitask real-time operating systems for control systems; system organization; static and dynamic process description; process creating, killing and switching techniques; different ways of interrupt servicing. 37. Examples of standard systems used in computer aided control systems: DOS, WINDOWS, LINUX, QNX; advantages and disadvantages of systems. 38. Basics of dedicated systems software development. 39. Typical data structures used in control systems; data structure developing criteria; data structure optimization techniques. 40. Multi-threat software development; process concurrency; access to common resources rules; collision in access detection and avoiding its methods; blockade and deadlock. 41. Correctness in concurrent process execution; examples of process scheduler algorithms; examples of scheduler testing methods. 42. Build-in microprocessor hardware support of multitask computations and tasks private resources protection mechanism. 43. Computer controlled systems examples. 44. Control software for microcomputers examples and some interesting details.</p>											
Prerequisites and co-requisites	No requirements
