GDAŃSK UNIVERSITY OF TECHNOLOGY

Subject card

Subject name and code	Maths I, PG_00072613		
Field of study	Mechanical Engineering		
Date of commencement of studies	October 2026	Academic year of realisation of subject	2026/2027
Education level	first-cycle studies	Subject group	Obligatory subject group in the field of study
Mode of study	Full-time studies	Mode of delivery	at the university
Year of study	1	Language of instruction	English
Semester of study	1	ECTS credits	10.0
Learning profile	general academic profile	Assessment form	exam
Conducting unit	Mathematics Center -> Vice-Rector For Education		
Name and surname of lecturer (lecturers)	Subject supervisor	dr Stanisław Domachowski	
	Teachers	dr Stanisław Domachowski	

Lesson types

Lesson type	Lecture	Tutorial	Laboratory	Project	Seminar	SUM
Number of study hours	45.0	60.0	0.0	0.0	0.0	105

E-learning hours included: 0.0

eNauczanie source addresses:
Moodle ID: 7380 WIMiO - DaPE - Maths I 2026/27 (S.Domachowski)
https://enauczanie.pg.edu.pl/2025/course/view.php?id=7380

Learning activity and number of study hours

Learning activity	Participation in didactic classes included in study plan	Participation in consultation hours	Self-study	SUM
Number of study hours	105	5.0	140.0	250

Subject objectives

The aim of this subject is for the student to obtain the competence in the range of using basic methods of mathematical analysis and linear algebra. Furthermore, the student is able to use this knowledge to solve simple theoretical and practical problems that can be found in the field of engineering.

Learning outcomes

Course outcome	Subject outcome	Method of verification
[K6_U01] is able to acquire information from professional literature, databases, and other sources, integrate and interpret it, and formulate justified conclusions and opinions for solving engineering problems	The student combines knowledge of mathematics with knowledge from other fields	[SU2] Assessment of ability to analyse information
[K6_W01] possesses advanced knowledge of mathematics, physics, and mechanics, applied to the modeling, analysis, and description of phenomena and processes occurring in mechanical systems	Student defines the basic concepts of differential calculus of one variable. Student analyses the properties of functions on the basis of an examination of its first and second derivatives. Student geometrically interprets the results of an examination of a graph of a function using the concept of limit, continuity and derivatives of functions. Student applies the basic rules and techniques of integration to calculate indefinite integrals. Student lists geometrical applications of definite integrals . Student distinguishes between types of improper integrals.	[SW1] Assessment of factual knowledge

Subject contents	Course content – lecture Functions of one variable and their properties: The absolute value function – definition, solving equations and inequalities with absolute value, graphs of functions with absolute value. Power functions – solving power and polynomial equations and inequalities. Rational functions – solving rational equations and inequalities. Exponential function – properties and graphs, solving exponential equations and inequalities. Logarithmic functions – properties and graphs, solving logarithmic equations and inequalities. Trigonometric and cyclometric functions – properties and graphs, solving trigonometric equations and inequalities.Infinite sequences. Fundamental definitions of a limit of a sequence, convergence and divergence, limit theorems. Applications to solving equation. Differential calculus of one variable functions and its applications: Definition of a first derivative and differential. Roll's and Lagrange's theorems. Higher derivatives and differentials. Monotonicity and local extrema. Convexity, concavity and inflexion points of a function. De l'Hospital's Thorem. Asymptotes. Applying differential calculus to studying the properties of one variable functions. Integral calculus of one variable functions – antiderivatives: The process of finding antiderivatives and integration formulas – the substitution method of integration and integration by parts. Integration of rational, trigonometric and irrational functions. Geometric application of definite integrals. Improper integrals. Course content – exercises Functions of one variable and their properties: The absolute value function – definition, solving equations and inequalities with absolute value, graphs of functions with absolute value. Power functions – solving power and polynomial equations and inequalities. Rational functions – solving rational equations and inequalities. Exponential function – properties and graphs, solving exponential equations and inequalities. Logarithmic functions – properties and graphs, solving logarithmic equations and inequalities. Trigonometric and cyclometric functions – properties and graphs, solving trigonometric equations and inequalities.Infinite sequences. Fundamental definitions of a limit of a sequence, convergence and divergence, limit theorems. Applications to solving equation. Differential calculus of one variable functions and its applications: Definition of a first derivative and differential. Roll's and Lagrange's theorems. Higher derivatives and differentials. Monotonicity and local extrema. Convexity, concavity and inflexion points of a function. De l'Hospital's Thorem. Asymptotes. Applying differential calculus to studying the properties of one variable functions. Integral calculus of one variable functions – antiderivatives: The process of finding antiderivatives and integration formulas – the substitution method of integration and integration by parts. Integration of rational, trigonometric and irrational functions. Geometric application of definite integrals. Improper integrals.
Prerequisites and co-requisites	

Assessment methods and criteria

Subject passing criteria	Passing threshold	Percentage of the final grade
written exam 90 minutes, tests, • Active participation during classes	50.0%	100.0%

eResources addresses	

Example issues/ example questions/ tasks being completed	1.Find the domain and the set of values of the function f(x)=log2(x+2). 2.Solve the equation :|x-3|2 -4|x-3|-12=0. 3. Solve the inequality: 36x4-97x2+36<0 . 4.Solve the equation: 11·52x -4x =3·22x+25x. 5.Solve the inequality: logx2(x+6)≥1. 6.Solve the equation: |cosx|=cosx+2sinx. 7.Find the domain and the set of values of the function f(x)=log2(x+2). Determine the inverse function of f. 8. Evaluate the limit of a given sequence an=(3n2+6n)½-3½n. 9. Evaluate the indefinite integral of the given rational function f(x)=(x+3)⁄(x3 +3x2 +4x+2). 10.Find local extremes and intervals of monotonicity of the following function f(x)= (x2 +4x+1)ex.
