

Subject card

Subject name and code	Parametric Modelling with Process and Design Optimisation, PG_00069217						
Field of study	Civil Engineering						
Date of commencement of studies	October 2023		Academic year of realisation of subject		2026/2027		
Education level	first-cycle studies		Subject group				
Mode of study	Full-time studies		Mode of delivery		at the university		
Year of study	4		Language of instruction		Polish		
Semester of study	7		ECTS credits		5.0		
Learning profile	general academic profile		Assessment form		assessment		
Conducting unit	Department of Engineering Structures -> Faculty of Civil and Environmental Engineering -> Faculties of Gdańsk University of Technology						
Name and surname of lecturer (lecturers)	Subject supervisor		dr inż. Przemysław Kalitowski				
	Teachers						
Lesson types	Lesson type	Lecture	Tutorial	Laboratory	Project	Seminar	SUM
	Number of study hours	15.0	30.0	0.0	0.0	0.0	45
	E-learning hours included: 0.0						
	eNauczanie source address: https://enauczanie.pg.edu.pl/2025/course/view.php?id=1975						
Learning activity and number of study hours	Learning activity	Participation in didactic classes included in study plan		Participation in consultation hours		Self-study	SUM
	Number of study hours	45		10.0		70.0	125
Subject objectives	The aim of the course is to develop skills in applying parametric modelling within Rhinoceros 3D and Grasshopper, as well as to introduce optimization methods used in structural design and analysis. Students learn how to create and modify parametric models, automate design workflows, and apply optimization techniques to solve structural engineering problems and support informed decision-making in the design process.						
Learning outcomes	Course outcome		Subject outcome		Method of verification		
	[K6_K03] Can effectively, clearly and unambiguously convey information, describe activities and communicate their results/ outcomes to engineers or a wider audience using appropriate communication methods and tools.		The student is able to prepare and present the results of modelling and optimization, clearly describing the applied algorithms and parameters in the Rhinoceros 3D + Grasshopper environment.		[SK3] Assessment of ability to organize work [SK4] Assessment of communication skills, including language correctness		
	[K6_K04] Engages in independent lifelong learning and individually follows the development of science and technology in the field of civil engineering.		The student is able to independently develop skills in parametric modelling by searching for information and solutions in documentation, technical materials for Rhino and Grasshopper, as well as using LLM tools.		[SK2] Assessment of progress of work [SK5] Assessment of ability to solve problems that arise in practice		

Subject contents	Course content – lecture		
	1. Introduction to parametric modelling in civil engineering. 2. Fundamentals of working in the Rhinoceros 3D and Grasshopper environment. 3. Parametrisation of structural geometry concepts and best practices. 4. Automation of design processes using Grasshopper components and scripting. 5. Deterministic and heuristic optimisation methods in structural design. 6. Sensitivity analysis and assessment of structural design variants. 7. Integration of CAD/CAE tools with parametric modelling workflows. 8. Case studies of parametric and optimisation applications in engineering practice.		
	Course content – exercises		
	1. Working with the Rhinoceros 3D interface basics of modelling. 2. Creating simple Grasshopper definitions input data, operators, geometry. 3. Building parametric relationships and controlling design variables. 4. Geometry automation and generation of structural variants: logical operators and conditional statements. 5. Formulating objective functions and constraints for optimisation tasks. 6. Using optimisation algorithms (e.g., Galapagos). 7. Analysing results and comparing design variants. 8. Developing the final parametric definition and preparing the results report.		
Prerequisites and co-requisites	The student should have basic knowledge of CAD tools and the ability to perform structural analysis and design of steel and reinforced concrete elements.		
Assessment methods and criteria	Subject passing criteria	Passing threshold	Percentage of the final grade
	Semester project	60.0%	100.0%

	eResources addresses	Basic http://rhino3d.com/learn/ - A collection of a large number of video materials covering 3D modelling and parametric modelling in Rhino 3D and Grasshopper.	
Example issues/ example questions/ tasks being completed	1. Creating a parametric model of a simple structure (beam, frame, or truss) in Rhinoceros 3D and Grasshopper. 2. Applying parametric relationships to control the geometry of an object (e.g., height, angle, number of divisions). 3. Implementing conditional logic and logical operators within a Grasshopper definition. 4. Generating multiple structural variants based on selected design variables. 5. Formulating an objective function and constraints for an optimisation task. 6. Performing structural optimisation using algorithms such as Galapagos. 7. Analysing the influence of parameter changes on geometry and structural behaviour. 8. Evaluating and comparing the performance of different design variants. 9. Automating a selected part of the modelling process using Grasshopper (e.g., generating sections, meshes, repetitive elements). 10. Preparing a final report describing the parametric definition, applied methods, and obtained results.
