GDAŃSK UNIVERSITY OF TECHNOLOGY

Subject card

Subject name and code	Mechanics of materials, PG_00064820		
Field of study	Mechanical Engineering		
Date of commencement of studies	February 2027	Academic year of realisation of subject	2026/2027
Education level	second-cycle studies	Subject group	Obligatory subject group in the field of study Subject group related to scientific research in the field of study
Mode of study	Full-time studies	Mode of delivery	at the university
Year of study	1	Language of instruction	Polish
Semester of study	1	ECTS credits	2.0
Learning profile	general academic profile	Assessment form	assessment
Conducting unit	Institute of Naval Architecture -> Faculty of Mechanical Engineering and Ship Technology -> Faculties of Gdańsk University of Technology		
Name and surname of lecturer (lecturers)	Subject supervisor	dr hab. inż. Beata Zima	
	Teachers		

Lesson types	Lesson type	Lecture	Tutorial	Laboratory	Project	Seminar	SUM
	Number of study hours	15.0	15.0	0.0	0.0	0.0	30
	E-learning hours included: 0.0						

Learning activity and number of study hours	Learning activity	Participation in didactic classes included in study plan	Participation in consultation hours	Self-study	SUM
	Number of study hours	30	5.0	15.0	50

Subject objectives	1. Providing knowledge in the field of analysis and solving problems of mechanics and strength of one-dimensional systems (bars, beams, frames). 2. Preparing the student to solve problems involving complex cases of material strength. 3.Developing the ability to solve statically and geometrically indeterminate frame systems.

Learning outcomes

Course outcome	Subject outcome	Method of verification
[K7_W01] explains and describes, on the basis of general knowledge of the scientific disciplines forming the theoretical basis of Mechanics and Mechanical Engineering, the structure and principles of operation of mechanical systems and processes	The student has the ability to apply computational methods and techniques for strength and material analysis to examine and describe the functioning of the specified systems, processes, and device properties.	[SW1] Assessment of factual knowledge
[K7_U15] evaluates the feasibility of advanced methods and tools for solving complex engineering tasks of a practical nature, characteristic of the field of study, and selects and applies appropriate methods and tools for this purpose	The student is able to assess the applicability of advanced methods and tools for solving complex engineering problems in the field of mechanics of materials. They effectively utilize appropriate techniques, such as strength analysis of structural elements as a basis for using the Finite Element Method (FEM), to develop practical technical solutions.	[SU2] Assessment of ability to analyse information
[K7_U01] utilizes information obtained from the literature and other sources in the field of Mechanics and Mechanical Engineering and presents and analyses the results of solutions to technical problems in this field	The student, equipped with knowledge of mathematical analysis methods and numerical experiments, is able to apply it to solve engineering tasks within the specified scope using the Finite Element Method (FEM) as a modern and effective computational approach implemented in commercial software systems (e.g., Femap, Ansys).	[SU2] Assessment of ability to analyse information [SU4] Assessment of ability to use methods and tools

Subject contents

Course content – lecture

1. Introduction, classification of structure elements. Specification and definitions of elements of bar and planar structures. Presentation: Internal forces in 2D and 3D bar systems.
2. Stress analysis. Definition of the stress vector with its components in the normal and tangential directions in the case of a three-dimensional Cartesian space; The concept of a stress tensor with its special cases. Thermal stresses.
3. State of deformation, constitutive relation. Description of the deformation state of three-, two- and one-dimensional deformations in terms of small displacements and deformations. Hooke's law and a general description of constitutive relations.
4. The principle of virtual work and its applications. The principle applies to the statics of bar systems in the variants of the theoretical basis of the Force Method (FM) and Displacement method (DM).
5. The Force Method and the Displacement Method. Definition of unknowns, coefficients for unknowns, canonical equation. Basics of the classical approach to the Displacement Method (DM) applied to beam and frame systems.
6. Tensile - axial compression. State of stress and deformation.
7. Bending. Moment applied about principal axis and moment arbitrarily applied.
8. Shear in bending. Center of shear (twisting).
9. Torsion of prismatic and thin-walled rods.
10. Failure theories - yield criteria.
11. Thin-walled pressure vessels.

Prerequisites and co-requisites

The student knows and is able to apply the laws of technical mechanics.
He knows and is able to solve simple cases of material strength.
He knows the basics of higher mathematics

Assessment methods and criteria

Subject passing criteria	Passing threshold	Percentage of the final grade
Solving problems	50.0%	60.0%
Lecture test	50.0%	40.0%

eResources addresses	

Example issues/ example questions/ tasks being completed

1. Draw the stress vector and its components in the general case of the vector location, name the components of the stress vector. What planes (sections) do we call the principal?
2. Give the rules for dimensioning the cross-section (determining the dimensions of the cross-section) taking into account the strength condition and the stiffness condition in the case of tension / compression.
3. Draw graphs of the maximum tangential and normal stresses in a cantilever loaded with a concentrated force P at its end.
